salt and the mixt. distd. with steam, there results an octene, b. $113-5^{\circ}$, which does not yield a solid nitroschloride. The difference in the chem. properties of the various types of salts is explained by a shifting of the double bond generated from the HO group. The aliphatic sulfones, being volatile with steam, may be partly responsible for the S content of refined gasolines. C. J. WEST

Constitution and the dissociation of the Grignard reagent. HENRY GILMAN AND ROBERT E. FOTHERGILL. *J. Am. Chem. Soc.* **51**, 3149-57(1929).—From the results of a study of 14 expts in which various RMgX reacted with Ph_2CO , evidence is presented for the equil. $2\text{RMgX} \rightleftharpoons \text{R}_2\text{Mg} + \text{MgX}_2$ and for the dissocn. $\text{RMgX} \rightarrow \text{R}- + -\text{MgX}$, of Grignard reagents C. J. WEST

Reactions relating to carbohydrates and polysaccharides. XXIII. Synthesis and properties of hydroxyalkylideneglycols and glycerols. HAROLD HIBBERT AND MYRON S. WHELEN. *J. Am. Chem. Soc.* **51**, 3115-23(1929); cf. *C. A.* **23**, 1402-3.—Condensation of 80 g. CH_2CHCHO and 120 g. $(\text{CH}_2\text{OH})_2$ with 40 cc. HCl at $0-4^{\circ}$ gives 70 g. β -chloropropylideneglycol (2-[β -chloroethyl]-1,3-dioxolane), b_p $70-2^{\circ}$, which gradually turns dark brown in color, warming with dil. aq. acid gives a very obnoxious odor, probably $\text{ClCH}_2\text{CH}_2\text{CHO}$, dry KOH in a Cu vessel gives about 50% of acrylideneglycol (2-allyl-1,3-dioxolane), b. $115-6^{\circ}$, with a strong, sweetish, slightly unpleasant odor; hydrolysis with dil. acids gives CH_2CHCHO . Oxidation with nearly satd. KMnO_4 soln. at 5° gives 41% of 1,2-dihydroxypropylideneglycol (2-dihydroxyethyl-1,3-dioxolane), b_p $136-8^{\circ}$, n_D^{17} 1.4695. Condensation of 112 g. CH_2CHCHO and 184 g. $\text{C}_6\text{H}_5(\text{OH})_3$ by heating several weeks at $50-60^{\circ}$ gives 10-5% of 1,2-acrylideneglycerol (2-allyl-1,3-dioxolane-4-carbinol) (I), b_p $98-105^{\circ}$, b $204-15^{\circ}$, n_D^{17} 1.4638, no indication was observed of the presence of the corresponding 6-membered acetal. I, MeI and Ag_2O give the α -Me ether, b_p 70° , b_{760} $174-8^{\circ}$, n_D^{17} 1.4408, which polymerizes after standing several months. Hydrolysis gives glyceryl α -Me ether, while oxidation gives 1,2-dihydroxypropylideneglycerol 1'-Me ether, b_{1-2} 146° , n_D^{17} 1.4680, which has no tendency to polymerize. Oxidation of I gives an oil, b_2 51° , which was not identified and a smaller amt. of 1,2-dihydroxypropylidene-1,2-glycerol (1,2-dihydroxyethyl-1,3-dioxolane-4-carbinol), b_3 $200-1^{\circ}$, n_D^{17} 1.4888, which has no tendency to polymerize. C. J. W.

Photochemical decomposition of lactic acid. G. RICHARD BURNS. *J. Am. Chem. Soc.* **51**, 3165-71(1929).—Lactic acid in H_2O is decomposed by radiations of wave lengths shorter than 2500 \AA . The chief products of decompn. by radiations from a quartz Hg arc are EtOH and CO_2 . CO , satd. and unsatd. hydrocarbons form about 9% of the gaseous products. Aldehyde, if produced, is present in quantities less than 1% of the total decompn. products. The ratio between the energy absorbed and the CO_2 produced corresponds to a quantum yield of approx. 0.65. More EtOH is produced than is required by the assumption that lactic acid decomps. into equal amts. of EtOH and CO_2 . The higher % of short wave length from the Hg arc produces a different type of decompn. from that produced by the Hg arc. The mixt. of gases produced changes in compn. with increasing age of the Hg arc. C. J. WEST

Preparation of *d*-glucuronic acid from gum arabic. FRITZ WEINMANN. *Ber.* **62B**, 1637-9(1929).—By short hydrolysis of *l*-rotatory gum arabic (Khordofan gum) with 0.5 *N* HCl there is obtained 40% of a gum acid with $[\alpha]_D^{23} -8.3^{\circ}$ (H_2O), contg. galactose bound to *d*-glucuronic acid (I). This on energetic hydrolysis (best with boiling *N* H_2SO_4) gives through the Ba salt almost pure I in 30% yield (based on the amt. present in the gum acid as detd. by the Tollens-Lefèvre method), or about 50 g. from 1 kg. of the gum. One crystn. from 90% alc. gives a pure product, m. 156° , $[\alpha]_D^{23}$ in H_2O (*c* 2.148) 13.5° (initial), 35.2° (after 2 hrs.). C. A. R.

Some observations on the acetoacetic ester condensation. S. M. McELVAIN. *J. Am. Chem. Soc.* **51**, 3124-30(1929).—Various theories of the $\text{AcCH}_2\text{CO}_2\text{Et}$ reaction are discussed. A study has been made of the action of EtONa on 4 simple esters, the reversal of the condensation was overcome by the removal of the EtOH by distn. as it was formed in the reaction. In this way the following yields of β -keto ester and EtOH were obtained: AcOEt , 68, 83, EtCO_2Et , 81, 97; PrCO_2Et , 76, 103; $\text{iso-PrCO}_2\text{Et}$, 0, 6%. The fact that the yield of the 2 products is not the same is due to difficulties of isolation and detn. On the basis of these results it seems that the original mechanism of the condensation proposed by Claisen, supplemented by the reversible feature, is the most acceptable of those that have been considered. C. J. WEST

New derivatives of creatinine and diketopiperazine. I. H. RICHARDSON AND CLAUDE E. WELCH WITH S. CALVERT. *J. Am. Chem. Soc.* **51**, 3074-9(1929).—Heating 5 g. creatinine and excess BzH or an equiv. amt. of PhN:CHPh gives 5-benzalcreatinine,

golden yellow, m. 244°; 5-m-nitrobenzal deriv., yellow, decomps. 288° (70% yield); 5-m-methoxy-p-hydroxybenzal deriv., decomps. 267° (75% yield). Heating 1.4 g. glycine anhydride, 4.5 g. vanillin, 4 g. AcONa and 8 g. Ac₂O at 120–30° for 8 hrs. gives 3,6-bis-[m-methoxy-p-acetoxybenzal]-2,5-diketopiperazine, bright yellow; in a similar manner were prepd. the following derivs.: cinnamal, piperonylidene, m-acetoxybenzal, methylbenzal (I) and o-chlorobenzal. The presence of HO groups in the enol form of diketopiperazine has been confirmed by the formation of the α -naphthyl isocyanate deriv., C₂₆H₂₀N₄O₄, m. 232° (decompn.); this condenses with aldehydes only after hydrolysis, the same product (I) being obtained with m-MeC₆H₄CHO as is obtained above. The m-nitrobenzal deriv. was obtained from this deriv. It therefore appears that the ordinary enol form of diketopiperazine has double bonds between C atoms. C. J. WEST

Reactivity of glucose in the presence of hydrochloric acid. II. EMYR ALUN MOELWYN-HUGHES *Trans. Faraday Soc.* **25**, 435–42 (1929); cf. C. A. **22**, 1888.—Evidence is adduced to show that condensation of glucose to diglucose is not due to a structurally active γ -glucose, but to a thermally stimulated glucopyranose mol., resembling normal glucose in structure but differing from it in being temporarily physically activated. LOUIS WALDBAUER

New conditions for the formation of glucosazone. C. L. BUTLER AND LEONARD H. CRETCHER *J. Am. Chem. Soc.* **51**, 3161–5 (1929).—The reaction of glucose or fructose with an equimol. amt. of PhNHNH₂ in cold dil. AcOH gives a high yield of glucosazone, instead of glucose phenylhydrazone as might be expected. Mannose, on the other hand, yields only the hydrazone under these conditions. Glucose and fructose phenylhydrazones are converted practically quant. to glucosazone on standing in dil. AcOH. Mannose phenylhydrazone is unchanged by this treatment. C. J. WEST

From formol to hexobioses. E. CATTELAÏN *J. pharm. chim.* [8], **9**, 70–7, 113–22, 153–63 (1929).—Historical review of the synthesis of the sugars, culminating in the recent syntheses of lactose, (C. A. **21**, 3602), maltose (C. A. **21**, 3046), sucrose (C. A. **22**, 2743), etc. Structural formulas and a list of 30 references are given. S. W.

Sequoiyte (sequoyitol) a cyclose from redwood (Sequoia sempervirens). E. C. SHEPARD AND E. F. KURTH. *J. Am. Chem. Soc.* **51**, 3139–41 (1929); cf. C. A. **22**, 2739.—The aq. ext. of redwood contains a mixt. of pinitol and sequoyitol (I), sepd. by fractional crystn. I crystallizes readily from a 50% EtOH, while pinitol crystallizes from a 70% soln. The yield on the basis of the wt. of the oven-dried heartwood varies from traces to 0.06%. I m. 234–5° and sublimes at temps. above this; it is optically inactive, does not reduce Fehling soln., gives no ppt. with PhNHNH₂ and is not affected by dil. acids or alkalis; with HNO₃ it is oxidized to (C₆H₅)₂. With Ac₂O and AcONa I gives a *pentacetate*, m. 198°. With HI I gives MeI and *dl*-inositol. I is therefore the monomer ether of *dl*-inositol. C. J. WEST

Polymethylbenzenes. I. Study of the Jacobsen reaction with pentamethylbenzene and the preparation of prehnitene. LEE I. SMITH AND ALBERT R. LUX. *J. Am. Chem. Soc.* **51**, 3004–3000 (1929).—The rearrangement known as the Jacobsen reaction (*Ber.* **20**, 896 (1887)) takes place essentially in the manner reported by J., although there are considerable amts. of tarry by products and J.'s equation does not represent all that happens. A typical reaction, of which 12 are reported, consisted in heating 74 g. C₆HMe₅ at 65° and adding the resulting oil, with vigorous stirring, to 200 cc. concd. H₂SO₄ at room temp. The mixt. is then cooled to room temp. and allowed to stand 24 hrs., after which it is cooled to 0°, 165–200 g. ice added in 3 portions and the product filtered. The filter cake is leached with about 700 cc. cold H₂O; the residue contains crude C₆Me₆ while the filtrate contains C₆HMe₅SO₃H. The C₆Me₆ is purified by distn. *in vacuo* and is obtained in over 70% yields. The C₆HMe₅SO₃H is best obtained by dropping the C₆HMe₅SO₃H in H₂O or as a thin paste in H₂O into dil. H₂SO₄ at 140–50° and distg. the C₆HMe₅SO₃H with steam as rapidly as it is formed by hydrolysis; the yield is 88% of the Na salt or about 65% based on the C₆HMe₅ used. In a run with 1000 g. C₆HMe₅ there were obtained 264 g. crude C₆HMe₅SO₃H and 610 g. crude C₆Me₆. The last step in the reaction is a sulfonation of the C₆HMe₅; it is the SO₃H acid, not the hydrocarbon, which rearranges. II. The melting points of the tetramethylbenzenes and of penta- and hexamethylbenzene and the freezing-point diagram of durenene and isodurenene. LEE IRVIN SMITH AND F. H. MACDOUGALL. *Ibid.* 3001–8.—Durenene (1,2,3,4-C₆H₄Me₄), recrystd. 4 times from 95% EtOH and then from C₆H₆, m. 79.28 ± 0.05°. C₆HMe₅, purified similarly, m. 54.0 ± 0.1°. C₆Me₆, recrystd. 4 times from CHCl₃ and then from C₆H₆, m. 164.8 ± 0.1°. Isodurenene (1,2,3,5-C₆H₄Me₄) was prepd. as follows: 1,3,5-C₆H₃Me₃ was brominated (the Br deriv. b_m, 105–7°, b₁₁, 102.5–3.5, m. 1° to +1°, yield 76–85%); the Grignard reagent from this and Me₃SO₄ give

1,2,3,5- $C_6H_3Me_4$, b_{17} 84.6-4.7°, m. -24.0 \pm 0.1° (60% yield). Prehnitene (1,2,3,4- $C_6H_3Me_4$) was prepd. according to the preceding paper; it was purified by converting it into the Br deriv., b_{50} 166-7°, m. 24°, and regenerating the hydrocarbon by the Grignard reagent and also through the picrate, m. 89.5-90.5°; the final product $b_{6.3}$ 75.0-5.5° (cor.) and m. -6.40 \pm 0.05°. The f.-p. curve for the system durenene-isodurene is given; from these data the mol. latent heat of fusion of isodurene is calcd. to be about 2550 cal. and of durenene to be 5022 cal.

C. J. WEST

***p*-Cymene studies. XII. 2-*p*-Cymyl-4-semicarbazide and certain derivatives.** ALVIN S. WHEELER AND J. G. PARKS. *J. Am. Chem. Soc.* **51**, 3079-82(1929); cf. *C. A.* **23**, 115.—Aminocymene and $CO(NH_2)_2$ give *di-p*-cymylurea, m. 240°; with $KCNO$ it gives *p*-cymylurea, which with $PhNHNH_2$ yields 2-*p*-cymyl-4-semicarbazide, m. 112°; *HCl* salt, m. 166-8° (decompn.). The following semicarbazones were prepd. from this reagent: acetone, m. 182° (all m. p. cor.); methyl ethyl ketone, m. 182-3°; α,γ -dichloroacetone, m. 173°; mesityl oxide, m. 163°; *Et* acetoacetate, m. 133.5°; cyclohexanone, yellow, m. 192.5°; camphor, yellow, m. 217°; curvone, yellow, m. 97°; benzophenone, m. 150°; acetophenone, m. 212°; benzoin, yellow, m. 172°. **XIII. *p*-Cymylhydrazine-2 and derivatives.** ALVIN S. WHEELER AND CHARLES L. THOMAS. *Ibid* 3135-9.—Reduction of the diazo compd. from 2-aminocymene (prepd. with $NaNO_2$) with Na_2SO_3 gives 72.5% of *p*-cymyl-2-hydrazine (I), m. 26.5°, b_5 129 32°, d_{28}^{20} 0.98623, n_D^{25} 1.5551; *HCl* salt, m. 198°; *II* Br salt, m. 174°; sulfate, m. 130°; picrate, yellow, decomp. 124°. The following hydrazones were prepd. from I: cinnamaldehyde, picric yellow, m. 90°; salicylaldehyde, yellow, m. 87°; benzophenone, slightly brown, m. 88°; *Me Et* ketone, unstable, m. 57°. With $CO(NH_2)_2$ I gives 1-*p*-cymyl-2-semicarbazide, m. 171°; the *thio* deriv., m. 184°. I and $p-O_2NC_6H_4COCl$ give the *p*-nitrobenzoyl deriv., yellow, m. 177°. CS_2 gives a compd. contg. 18.75% N and 21.25% S, m. 177°. C. J. W.

Cleavage of azo dyes by means of sulfites. KARL H. ENGEL. *J. Am. Chem. Soc.* **51**, 2986-94(1929).—Monoazo dyes combine with 2 mols. of a neutral sulfite, in soln., suffering cleavage into a primary amine and the salts of *N*- SO_3H and *N*-di- SO_3H acids. 4- $HOC_6H_4N_2Ph$ yields approx. 0.78 mol. $PhNH_2$, 0.22 mol. of an *N*- SO_3H deriv. of $PhNH_2$, 0.78 mol. of an *N*-di- SO_3H and 0.22 mol. of an *N*- SO_3H deriv. of 4- $HOC_6H_4NH_2$ but no traces of unsulfonated $HOC_6H_4NH_2$. 4,4'- $HOC_6H_4N_2C_6H_4SO_3H$ reacted similarly, sulfanilate being formed as a result of cleavage. Hydrolysis and rearrangement of free *N*- SO_3H derivs. resulted in complete recovery of the primary dye component in its original form; the sec. component yielded 4,5- $HO(SO_3H)_2C_6H_3NH_2$ and an extremely sol. stable 1-amino-4-phenolsulfonic acid. An explanation of the cleavage reaction has been suggested, founded on an assumption of functional differences between the 2 N atoms of the azo group. The original should be consulted for the exptl. details of the sepn. of the cleavage products.

C. J. WEST

Constitution of triphenylsilicane and its reaction with sodium in liquid ammonia. HARRY H. REYNOLDS, LUCIUS A. BIGELOW AND CHARLES A. KRAUS. *J. Am. Chem. Soc.* **51**, 3067-72(1929).— $PhMgBr$ and $SiHCl_3$ give 73% of triphenylsilicane, b_2 152-67°, m. 36-7°; this is quantitatively brominated, giving Ph_3SiBr and HBr , which was hydrolyzed to Ph_3SiOH . In liquid NH_3 , Ph_3SiH and Na give *di*[triphenylsilicon]imine (I), m. 175°; its constitution was established by hydrolysis with HCl , giving NH_4Cl and Ph_3SiOH . Upon bromination I gives Ph_3SiBr , $PhBr$, a little $(Ph_3Si)_2O$ and pasty by-products. I is quantitatively stable to boiling alkali.

C. J. WEST

Series arrangement of organic groups. I. As determined by the halogenation of mixed stannanes. RALPH H. BULLARD. *J. Am. Chem. Soc.* **51**, 3065-7(1929).— Ph_3SnNa and $PhCH_2Cl$ in liquid NH_3 give triphenylbenzylstannane, m. 90-1°, bromination in $C_6H_6-CCl_4$ gives $PhBr$ and phenylbenzylstannyl dibromide, m. 74-5°. From this result and other data from the literature the series arrangement of some org. groups based on the relative ease of removal from Sn by halogen is: Ph , $PhCH_2$, Me , Et , Pr .

C. J. WEST

Triphenyllead chloride and diphenyllead dichloride. HENRY GILMAN AND JACK D. ROBINSON. *J. Am. Chem. Soc.* **51**, 3112-4(1929).— Ph_3PbCl is obtained in about 75% yield by passing HCl into Ph_4Pb in $CHCl_3$ near its b. p. for about 15 min. or until crystals of Ph_2PbCl_2 begin to sep.; after boiling the soln. until all the HCl has reacted and evapg. the $CHCl_3$, boiling $EtOH$ exts. the Ph_3PbCl . Excess HCl and Ph_4Pb in C_6H_6 at 50° give 98.5% of Ph_2PbCl_2 .

C. J. WEST

***N*-Phenyl- β -aminopropionamide-4-arsonic acid and related compounds.** CLIFF S. HAMILTON AND CARTER L. SIMPSON. *J. Am. Chem. Soc.* **51**, 3158-61(1929).— β -Bromopropionyl chloride, from the acid and PCl_5 , b_{21-20} 65-70°; concd. NH_4OH gives β -bromopropionamide, m. 110-1°. One mol. equiv. of the aminoarylarsonic acid in the

calcd. amt. of *N* NaOH to form the Na salt is treated with 1.5 mol. equivs. of the amide and boiled for 5 hrs.; sufficient concd. HCl is added to the hot soln. to hold any unchanged As acid in soln. There were thus prepd. *N*-phenyl- β -aminopropionamide-4-arsonic acid (I), 35–40% yield (Na salt, needles); the 2-methyl-4-deriv., 25–30% and the 2-methyl-5-deriv., 15–20%. Hydrolysis of I by boiling with 2 *N* NaOH for 3 hrs. gives *N*-phenyl- β -aminopropionic acid-4-arsonic acid, does not m. at 250°. *N*-4-Methylcarbamidophenylarsonic acid results in 25% yield from MeNHCOCl and *p*-H₂NC₆H₄AsO₃H₂. I (5.8 g.) and 4.7 g. 3,4-H₂N(HO)C₆H₃AsO₃H₂ in 50 cc. concd. HCl and 30 cc. H₂O, treated with 50 cc. 50% H₂P₂O₆, give 4.2 g. of 3-amino-4-hydroxy-4'-propionamidaminoarsenobenzene-di-HCl, yellow; the free base, yellow, decomps. 120–5°. Preliminary pharmacol. tests indicate that I may be useful in treatment of trypanosomal infections.

C. J. WEST

Monobromoguaiacol carbonate. Estimation of guaiacol carbonate. LEWIS H. CHERNOFF. *J. Am. Chem. Soc.* **51**, 3072–4 (1929).—Guaiacol carbonate (I) and Br in MeOH give the *Br* deriv., m. 178°. I may be detd. by heating 0.1–0.5 g. in 10–20 cc. MeOH until soln. results, adding 1 cc. Br, allowing the mixt. to stand 10 min., then adding an equal vol. H₂O and again allowing to stand 10 min. The ppt. is washed with 50% MeOH. The error is from 1.2% with 0.5 g. to 0% with 0.01 g. I. The error is larger if only 0.25 vol. of H₂O is added. In mixts. with the usual excipients a preliminary sepn. by the use of proper solvents may be made.

C. J. WEST

Preparation of quinhydrone. P. MÜLLER. *Z. Pflanzenernähr., Düngung u. Bodenk.* **14A**, 170 (1929).—Quinhydrone may be prepd. in the lab. from NH₄Fe(SO₄)₂ and hydroquinone at a small fraction of the cost of the com. product.

R. M. B.

Beckmann rearrangement in the presence of free radicals. EVERETT S. WALLIS. *J. Am. Chem. Soc.* **51**, 2982–6 (1929).—PhCH₂CHMeCON₃, allowed to rearrange in the absence of air in a C₆H₆ soln. of Ph₃C, gives only PhCH₂CHMeNCO. A discussion of this fact with reference to certain theories on the Beckmann rearrangement is given.

C. J. WEST

1,6-Addition of hydrogen to unsaturated 1,4-diketones. ROBERT E. LUTZ. *J. Am. Chem. Soc.* **51**, 3008–23 (1929).—(*p*-ClC₆H₄COCH)₂ (70 g.) and Br in CHCl₃ give 49 g. of the *meso*-di-*Br* deriv. and 49.5 g. of *dl*-1,2-di[4-chlorobenzoyl]-1,2-dibromoethane, m. 124.5°; in AcOH 50 g. of the ethylene gives 55 g. of the *meso*- and 18 g. of the *dl*-di-*Br* derivs. With 2 equivs. of MeONa there results 1,2-di[4-chlorobenzoyl]methoxyethane, m. 130°. 1,2-Dibenzoyl-3-methoxyphenoxyethylene, m. 110°, in 10% yield from *m*-MeOC₆H₄OH, (BzCHBr)₂ and EtONa. *m*-MeC₆H₄OH gives 2 forms of 1,2-dibenzoyl-3-methylphenoxyethylene, m. 95° and 103°. Reduction of BzCH₂C(OMe)Bz with Na₂S₂O₄ in EtOH and H₂O gives diphenylmethoxyfuran, m. 48.5–9°; long heating does not appreciably affect the yield of the furan, so that the BzCH₂CH(OMe)Bz, once formed, is stable and not appreciably dehydrated to the furan under these conditions. Ac₂O and concd. H₂SO₄ do not dehydrate the ethane to the furan but give oils and a colorless solid to be investigated later. Decompn. of BzCH₂CH(OMe)Bz by heating at 210–5° for 20 min. gives MeOH and (ClC₆H₄COCH)₂. ClC₆H₄COCH·C(OMe)COC₆H₄Cl, Ac₂O, AcOH and Zn, on boiling, give 2,5-di[4-chlorophenyl]methoxyfuran, m. 114°; reduction with Na₂S₂O₄, EtOH and H₂O gives 1,2-di[4-chlorobenzoyl]methoxyethane, m. 61.5°, which is converted into the furan by Ac₂O and a trace of H₂SO₄. Heating the ethane at 200° for 10 min. gives MeOH and (ClC₆H₄COCH)₂. Reduction of BrC₆H₄COCH·C(OMe)COC₆H₄Br with Zn and AcOH gives 2,5-di[4-bromophenyl]methoxyfuran, m. 113°; reduction with Na₂S₂O₄ gives 1,2-di[4-bromobenzoyl]methoxyethane, m. 72°, which decomps. at 210–20° as the Cl deriv. Reduction of BzCH₂C·(O⁺Ph)Bz by Zn and AcOH, CrCl₃ or Na₂S₂O₄ gives 1,2-dibenzoylphenoxyethane, m. 120°. Ac₂O and H₂SO₄ give 2,5-diphenyl-3-phenoxyfuran, m. 91°. 1,2-Dibenzoyl[4-methylphenoxy]ethane, m. 108.5°; 2,5-diphenyl-3-[4-methylphenoxy]furan, m. 113°. The action of reducing agents on unsatd. 1,4-diketones is given as a table, the % yields of the ethane and furan being given. In some cases the MeO or aroxyl group is removed by the action of the reducing agent. The bearing of these facts on the theory of 1,6-addn. of H to unsatd. 1,4-di-C:O compds. is discussed and the conclusion is drawn that the dienol postulated by the theory is actually formed as the primary intermediate in reduction and accounts for the formation of the furans.

Reactions of vinyl chloride and benzene in the presence of aluminium chloride. JAMES M. DAVIDSON and ALEXANDER LOWY. *J. Am. Chem. Soc.* **51**, 2978–82 (1929).—CH₂.CHCl, C₆H₆ and AlCl₃ give Ph₂CHMe (I), 9,10-dimethyldihydroanthracene (II) and an anthracene-type resin. No styrene or metastyrene was formed. PhCHClMe is considered as the most probable intermediate. Increased amts. of AlCl₃ at low temps. decreased the amts. of I. The amts. of II were increased by using a higher temp.

or by the presence of I. Hg caused the formation of PhEt and considerably decreased the amt. of resin formed. Certain phys. and chem. properties of the resin have been studied.

C. J. WEST

1,2-Benz-3,4-anthraquinone. LOUIS F. FIESER AND EMMA M. DIETZ. *J. Am. Chem. Soc.* **51**, 3141-8(1929).—(4-Methoxynaphthyl-1)-phenylmethane-2'-carboxylic acid, m. 221-3° (cor.), results in 91% yield by reduction of the corresponding naphthoyl deriv. with Zn and NaOH; ring closure takes place with concd. H₂SO₄ at 20°, giving 3-methoxy-1,2-benz-10-anthrone, pale yellow, very sensitive to heat and to O, particularly in soln., and was not purified (*Ac deriv.*, m. 197° (cor.)). Reduction with Al-Hg and NH₄OH under very carefully controlled conditions gives 45-55% of 3-methoxy-1,2-benzanthracene (I), straw-colored, m. 167-8°, oxidized in AcOH with Cr₂O₃ to 3-methoxy-1,2-benz-9,10-anthraquinone, brown-red, m. 188.5°, which forms a red vat with alk. Na₂S₂O₄; the concd. H₂SO₄ soln. is deep blue-green. Hydrolysis of I with 40% HBr gives 3-hydroxy-1,2-benzanthracene (II), orange-yellow, m. 196-205° (*Ac deriv.*, m. 129°). Oxidation of the *Ac deriv.* gives nearly quant. 3-acetoxy-1,2-benz-9,10-anthraquinone, yellow, m. 232°. Sapon. gives the 3-HO deriv., which was not purified. II yields a 4-[*p*-nitrobenzeneazo] deriv., dark red, which is reduced in the moist state in BuOH with SnCl₂ and concd. HCl, giving 4-amino-3-hydroxy 1,2-benzanthracene, decomps. easily in soln. in the absence of a reducing agent but analyzed as the triacetate, m. 203-5° (cor.) and as the oxazole deriv., C₂₀H₁₁ON, light yellow, m. 175.5°; oxidation with Cr₂O₃ in AcOH gives 57% of 1,2-benz-3,4-anthraquinone (III), red, m. 262-3° (cor., some decompn.). Reduction and acetylation gives 3,4-diacetoxy-1,2-benzanthracene, m. 201° (cor.), oxidized to 3,4-diacetoxy-1,2-benz-9,10-anthraquinone, yellow, m. 198.9°, which in turn is hydrolyzed to the 3,4-di-HO deriv., purplish black powder. Oxidation of III with H₂O₂ in AcOH gives 4,5-benzodiphenyl 2,2' dicarboxylic acid, pale tan, m. 252° (cor.), and giving with concd. H₂SO₄ 1,2(or 2,3)-benzo[*a*]norenone-4(or 5)-carboxylic acid, yellow, m. 268° (cor.).

Reduction potentials of various phenanthrenequinones. LOUIS F. FIESER. *J. Am. Chem. Soc.* **51**, 3101-11(1929).—The normal reduction potentials at 25° of 43 phenanthrenequinones have been detd. and an analysis of the data indicates that an isophenanthrenequinone, such as 1,4-phenanthrenequinone, has a somewhat higher potential than the corresponding naphthoquinone; the difference results from the substituting of a C₁₀H₈ group for the less reactive C₆H₄ group. The abnormally high potential of the 9,10-deriv. is due to a strain resulting from some peculiar spatial arrangement of the mol. Among the substituted 9,10-phenanthrenequinones, a group has the same effect on the potential when it is *o*- or *p*- to a quinonoid CO group and the effect is much greater than when the substituent occupies either of the *m*-positions. A 2nd substituent has a somewhat greater influence than the 1st. The potential is increased by the substitution of NO₂, CN, CO, CO₂H, Br and SO₂H groups; it is decreased by NH₂, alkyl, HO and MeOH groups. *Ac phenanthrene-3-carboxylate*, m. 97°; oxidation gives the *quinone*, orange-yellow, m. 212°. 3-Benzoylphenanthrenequinone, golden yellow, m. 205-6°.

C. J. WEST

α -Furfuryl chloride and its derivatives. II. W. R. KIRNER AND G. HOLMES RICHTER. *J. Am. Chem. Soc.* **51**, 3131-5(1929); cf. K., *C. A.*, **22**, 3162.—Furfuryl chloride (I) and CH₂(CO₂Et)₂ give 76% of the *Et ester* (II), b₄ 125.5-7°, d₂₀²⁰ 1.11196, d₄²⁰ 1.10999, n_D²⁰ 1.4591, of α -furfurylmaleonic acid. II and EtI give the *Et deriv.*, b₅ 135.5-6.5° (67% yield); with CO(NH₂)₂ and EtONa this gives α -furfurylbarbituric acid, m. 186-7.5° (37% yield); *Et deriv.*, m. 144.5-5° (51% yield). *Et* α -furfurylacetate, b₄ 110-1.5°, d₂₀²⁰ 1.10562, d₄²⁰ 1.10366, n_D²⁰ 1.4718 (61% yield); acid decompn. gives 75% of 2- α -furfurylacetic acid, m. 56.5-8°, and 12% of α -furfurylacetone, whose semicarbazone m. 140-1°. I and NaCN in H₂O at 70° give 90% of α -furfuryl nitrile, b₂₇ 74-5°, d₂₀²⁰ 1.04813, d₄²⁰ 1.04627, n_D²⁰ 1.4833, hydrolyzed to α -furylacetic acid, m. 108.5-9.5° (43% yield). α -Furfuryl thiocyanate, b₂₇ 111.5-2.5°, b₂ 66-7°, d₂₀²⁰ 1.18919, d₄²⁰ 1.18709, n_D²⁰ 1.5614. I, condensed with CS(NH₂)₂ and then hydrolyzed, gives α -furfuryl mercaptan, b₆₅ 84°, d₂₀²⁰ 1.13386, d₄²⁰ 1.13186, n_D²⁰ 1.5329; the Na deriv. and EtBr give α -furfuryl *Et sulfide*, b₂₈ 90.5-1°, d₂₀²⁰ 1.05144, d₄²⁰ 1.04958, n_D²⁰ 1.5140.

C. J. WEST

Saponins and allied compounds. XXI. The sarsaparilla saponins and their hydrolysis products. The synthesis of a saponin from parigenin and β -glucose. A. W. VAN DER HAAR. *Rec. trav. chim.* **48**, 726-42(1929); cf. *C. A.* **22**, 1979.—The pulverized Honduras root gave on extrn. with petroleum ether a substance which on hydrolysis yields sitosterol (Lieberman test for cholesterol). Then the root was extrd.

with ether, giving a residue which, on crystn. from EtOH-AmOAc, gave *sitosterol glucoside*, m. 290–95° (cf. P. and S., *l. c.*). On hydrolysis this glucoside gave *sitosterol*, m. 130°. After the extrn. with petroleum ether and ether the root was extd. with 99% MeOH; from the MeOH soln. the saponins were pptd. by means of ether and then purified by dialysis. Recrystn. from 30% EtOH gave a small amt. of the saponin *parillin*, far the greater part being kept in soln. by the sarsasaponin. After several crystns. from 30% EtOH the *parillin*, $C_{44}H_{72}O_{17} \cdot 6H_2O$, m. 238–40°; $[\alpha]_D -63.7^\circ$, mol. wt. (Rast) 842 for the anhyd. substance (calcd. 872); by means of the Zerevitinov method the presence of 10 OH groups was demonstrated. On hydrolysis with 5% H_2SO_4 in 30% EtOH *parillin* yields the sapogenin *parigenin*, $C_{26}H_{42}O_4$ with 1–1.5 H_2O , m. 200° when prepd. from Honduras root and 203° when obtained from Vera Cruz root, contains 1 OH group according to the method of Zerevitinov, $[\alpha]_D -69.6^\circ$, mol. wt. 337 in phenol, 1119 in benzene (b.-p. method) and 3441 in benzene (f.-p. method); (calcd. 402); *acetylparigenin*, m. 130°. On distn. over Zn powder in a H atm., *parigenin* yields a hydrocarbon with a mol. weight of 190°, probably a sesquiterpene. The hydrolysis of *parillin* only gives *rhamnose* and *glucose* and the quant. detn. showed that 1 mol. of the saponin yields 1 mol. of *rhamnose* and 2 mols. of *glucose* (cf. van der Haar, *Anleitung zum Nachweis usw. der Monosaccharide und Aldehydsäuren*, Bornträger, Berlin, 1920). As *parigenin* only contains 1 OH group while *parillin* has no reducing properties, it follows that *parigenin* is bound to a trisaccharide by means of this OH group. Partial hydrolysis of *parillin* yields *rhamnose* and a prosapogenin which only contains *glucose* and therefore the configuration I is ascribed to *parillin*, which contains 10 OH groups, as was shown experimentally. The soln. of sarsasaponin and *parillin*, which was obtained after part of the latter had crystd. (see above), was hydrolyzed with 5% H_2SO_4 and investigated according to v. d. H.; pentoses, *d*-galactose *d*-mannose, *d*-fructose and aldehydic acids were shown to be absent, while the presence of *rhamnose* (m. 92°; *p*-tolylhydrazone, m. 166°) and *glucose*, m. 148°, $[\alpha]_D 52^\circ$ (phenyllosazone, m. 208°), was demonstrated. From the root already extd. with petroleum ether, ether and 99% MeOH, the Ca-Mg compd. of a polysaccharide was obtained by extrn. with boiling 45% EtOH the so-called polysaccharide was shown to consist of 8.2% water, 1% ash, 5.1% pentoses, 2.95% methylpentoses, 3% aldehydic acids, 42.5% hexoses and 7.4% insol. matter, total 70.15%, the rest is to be regarded as impurities. On 5 g. *parigenin* in 40 cc. dry toluene and 4 cc. dry quinoline with 5.1 g. acetobromoglucose during a few min. and sapon. the Ac groups, *parigenin glucoside*, m. 225–30°, was obtained in 2% yield; this, on hydrolysis with 4% H_2SO_4 , gave *parigenin*, m. 206°.

Parachor and chemical constitution (SUGDEN, *et al.*) 2. Organic dipole molecules with singly and doubly bound O (WOLF) 2. Volume of metal alkyls (HERZ) 2. Reactions of C_2H_4 , H and the saturated hydrocarbons under the influence of excited Hg (TAYLOR, HILL) 3. The structure of 3 organic substances (BURGENI, *et al.*) 2. A hydrocarbon model (MÜLLER) 2. Some examples of information obtainable from the long spacings of fatty acids (PIPER) 2. Absorption of ultra-violet light by some purine derivatives and allied substances (MARCHLEWSKI, WIERZUCHOWSKA) 3. Absorption of light by some organic substances (MARCHLEWSKI, WYROBEK) 3. The crystal structure of picric acid (BREDIG, MÖLLER) 2. The thermal behavior of the phenols (HAGEMANN) 2. Electric moments of some substitution products of C_6H_6 and diphenyl (WEISSBERGER, WILLIAMS) 2. The structure of some fundamental aromatic compounds (HENGSTENBERG, MARK) 2. The structure of the C_6H_5 ring in $C_6(CH_3)_6$ (LONSDALE) 2. X-ray evidence on the structure of the C_6H_6 nucleus (LONSDALE) 2. A generalization of stereochemistry (GOLDFINGER) 2. Diffraction of x-rays in liquids: C_6H_6 , cyclohexane and certain of their derivatives (STEWART) 3.

Partial oxidation of gaseous hydrocarbons. HENRY R. CURME (to Carbide & Carbon Chemicals Corp.). U. S. 1,729,711, Oct. 1. Hydrocarbon material such as C_2H_6 or the like contg. a preponderance of normally gaseous paraffins of greater mol. wt. than CH_4 is mixed in excess with an oxidizing gas such as air and the mixt. is heated to above 600° in contact with vitreous material only and under such conditions that CH_2O is formed; the CH_2O produced is sepd. (suitably by condensation) and the mixt. is reheated to obtain an addnl. quantity of CH_2O , etc.

Halogenated anilines. WILLIAM J. HALE and GEORGE H. CHENEY (to Dow Chemical Co.). U. S. 1,729,775, Oct. 1. In forming halogenated arylamines such as *o*-chloroaniline, reaction is effected between anhyd. NH_3 and a polyhalogenated aromatic hydrocarbon such as *o*-dichlorobenzene in the presence of a Cu compd. such as Cu_2Cl_2 .

Ethers of propylene glycol. JOSEPH G. DAVIDSON (to Carbide and Carbon Chemicals Corp.). U. S. 1,730,061, Oct. 1. Monoalkyl ethers of propylene glycol are prepd. under heat and pressure by reaction of Me, Et, iso-Pr, Pr, iso-Bu, Bu and iso-Am alcs. with propylene oxide and the resulting mono-ethers b_{736} , resp., 122.8° , 133° , 141.5° , 150° , 161.3° , 170.6° and 183.3° . Corresponding di-ethers may be prepd. from propylene glycol or from propylene chlorohydrin and a dialkyl sulfate in the presence of NaOH. The pure ethers and their mixts. may be used as solvents for gums, resins and cellulose esters.

Ketones of the anthracene series. ARTHUR LÜTTRINGHAUS and FILIP KACER (to General Aniline Works). U. S. 1,730,081, Oct. 1. α - or β -Anthracyl alkyl ketones are converted into anthraquinonyl alkyl ketones by treatment with oxidizing agents, such as chromic acid dissolved in glacial acetic acid. α - and β -Anthracyl methyl ketone yield α - and β -anthraquinonyl methyl ketone, resp., and 1,5-diacetylanthracene yields 1,5-diacetylanthraquinone. The resulting anthraquinone derivs. may be used as starting materials for the production of dyestuffs. β -Anthraquinonyl methyl ketone m. $140-2^\circ$; 2-propionylanthraquinone m. $138-40^\circ$.

Derivatives of dihydrocodeinone and its substitution products. CLEMENS SCHÖFF (to the firm C. H. Boehringer Sohn). U. S. 1,731,152, Oct. 8. When dihydrocodeinone

or its substitution products or salts thereof, in which ring III contains no hydroxy group, *e. g.*, bromodihydrocodeinone, are subjected to acylation, new acyl derivs. are obtained which contain the acyl residue in ring 3. Acylation is preferably effected by treating the initial material with an excess of org. acid anhydride. By treating dihydrocodeinone with Ac_2O , acetyl dihydrocodeinone is obtained which can be crystd. from alc. in which it is much more sol. than dihydrocodeinone. It m. $154-5^\circ$. The chlorohydrate crystallizes from water in the form of fine needles, m. $132-135^\circ$ with decompn. Also other acylating agents such as acetyl chloride may be used. The methiodide of the butyryldihydrocodeinone crystallizes from alc. in rectangular plates which on heating to 125° froth slightly and m. $220-222^\circ$. The bromohydrate of the butyryldihydrocodeinone m. 225° on being crystd. twice from dil. MeOH. The methiodide of the benzoyldihydrocodeinone, after recrystn. from glacial HOAc and MeOH, m. $240-242^\circ$ with frothing. The bromohydrate of the acetylbromodihydrocodeinone, which can be obtained from water in the form of beautiful crystals, m. $128-132^\circ$. The products, which are probably acyl compds. of the enol form, are stable in the form of salts even when their aq. solns. are boiled for a long period. They are only split up on boiling with concd. acids when the original keto bases are reformed. The compds. are applicable in therapy. Cf. C. A. 23, 4748.

Benzyl mercaptans, etc., for mineral flotation separation, etc. RAYMOND W. HESS and JOSEPH M. F. LEAPER (to Barrett Co.). U. S. 1,729,615, Oct. 1. Production

of benzyl mercaptan is accomplished by reacting a benzyl halide with an alkali metal thiosulfate in an aq. medium and, without isolating from soln. the alkali metal benzyl thiosulfate thus produced, acidifying and heating the resulting reaction mixt. whereby benzyl mercaptan, or a compn. contg. benzyl mercaptan, is formed and pptd. in an impure state as an insol. substance which is subsequently removed from the soln. Details are given of the production of crude benzyl mercaptan, a liquid usually having a more or less yellow color. In general, it contains about 60-75% benzyl mercaptan, 20-35% benzyl disulfide, the remainder consisting mainly of other decompn. products of Na benzyl thiosulfate. It appears to be substantially free from benzyl monosulfide. The benzyl mercaptan may be sepd. from the crude product. The crude or impure product, without purification, is suitable as a flotation agent in the sepn. of minerals and the concentration of ores by flotation.

Butyraldehyde. MARTIN MUGDAN and JOSEPH WIMMER (to Consortium für Elektrochemische Industrie). U. S. 1,730,587, Oct. 8. See Can. 276,824 (C. A. 22, 2573).

Urea. HARRY C. HETHERINGTON and HERBERT J. KRASE (to Arthur B. Lamb, trustee). U. S. 1,730,208, Oct. 1. In producing urea from synthetic NH_3 made from gases contg. CO_2 , N and H, the H and N are sepd. from the CO_2 by use of an aq. soln. of an NH_4 salt as an absorbent, the CO_2 is recovered, the H and N are combined to form NH_3 , the CO_2 and NH_3 are caused to react to form urea and CO_2 present in the unconverted urea synthesis gases is removed in a combined operation with the removal of the CO_2 from the H and N for use in the process. An arrangement of app. is described.

p-Dimethylaminodiphenylguanidine. WINFIELD SCOTT (to Rubber Service Laboratories Co.). U. S. 1,730,388, Oct. 8. Phenyl mustard oil is caused to react with p-aminodimethylaniline to produce a thiourea and the latter is then desulfurized.

p-Dimethylaminophenyl-o-tolylguanidine. WINFIELD SCOTT (to Rubber Service Laboratories Co.). U. S. 1,730,536, Oct. 8. o-Tolyl mustard oil is caused to react with p-aminodimethylaniline to produce a thiourea and the latter is desulfurized.

p-Dimethylaminophenyl-p-phenetidylguanidine. WINFIELD SCOTT (to Rubber Service Laboratories Co.). U. S. 1,730,537, Oct. 8. Phenetidyl mustard oil is caused to react with p-aminodimethylaniline to form a thiourea and the latter is desulfurized.

Chlorosubstituted products of 1-amino-2,4-dimethylbenzene. ERWIN HOFFA, ERNST RUNNE and ERWIN THOMA (to General Aniline Works). U. S. 1,730,729, Oct. 8. When Cl reacts upon a soln. of 1-amino-2,4-dimethylbenzene in concd. H_2SO_4 , the Cl enters in m-position to the amino group and 3-chloro-1-amino-2,4-dimethylbenzene is produced as well as 5-chloro-1-amino-2,4-dimethylbenzene. When the action of the Cl is continued, a second Cl atom easily enters the nucleus with formation of 3,5-dichloro-1-amino-2,4-dimethylbenzene. The 3,5-dichloro deriv. may be sepd. as a sulfate by proper adjustment of the concn. of H_2SO_4 , in which it is but slightly sol. Catalysts such as FeCl_3 , I, etc., may be used in the chlorination, but are not essential. Several examples are given.

Viscosity of egg albumin and its variation in fresh and preserved eggs. D. CORTESÉ. *Ann. chim. applicata* 19, 260-5(1929).—The viscosity of egg albumin has been detd. at ordinary temps., fresh and after standing, the viscosity dropping from about 35.0 to 7-8 in 4 weeks. However, with eggs held at 1-2°, this drop in viscosity requires 5 months. A. W. CONTIERI

The mechanism of enzyme action. III. The relation between enzyme action and adsorption. F. F. NORD and J. WEICHERTZ. *Z. physiol. Chem.* 183, 191-217

(1929); cf. *C. A.* 22, 4544.—The influence of the unsatd. hydrocarbons, C_2H_4 , C_2H_2 and C_6H_{10} , on the fermentation of glucose by yeast was studied in a special fermentation app. provided with a dropping funnel, exit tube for CO_2 and mech. stirrer with Hg seal. The hydrocarbon was added in the form of satd. aq. soln. C_2H_2 and C_2H_4 are adsorbed from the liquid medium on the surface of the yeast cells. The initial effect is an external narcosis which inhibits merely the cell metabolism, while the enzymes in the interior maintain their full activity. The gas adsorbed on the surface then diffuses into the cell and by increasing the permeability bring about an increase in performance of the cell. With further penetration into the cell there is an adsorption on the surface of the enzymes present in the interior, resulting in an internal narcosis or inhibition of enzyme action. The activity of the cell is then the resultant of these 3 phases of action, viz., external narcosis, increase in permeability and internal narcosis. At the outset the first of these factors predominates, but as soon as the substance penetrates, the external effect diminishes because of diminishing concn. on the outer surface and increasing permeability. After a time the external narcosis disappears completely and only an increase in cell activity is observed. But this heightened activity is soon counterbalanced by internal narcosis so that an inhibition appears. The strong diffusion of the C_2H_2 or C_2H_4 thus causes a succession of max. action from external narcosis, through permeability increase, to internal narcosis. The greater the concn. employed the more rapid is the penetration into the cell, and consequently the more rapid the succession of the 3 phases of action. It is even possible that the permeability increase may be completely obscured by the rapid onset of internal narcosis. The permeability of bottom yeast is greater than that of top yeast, but on the other hand bottom yeast contains more lipoids. Both C_2H_4 and C_2H_2 are lipid-sol., hence they penetrate bottom yeast much more easily than top yeast. C_2H_4 diffuses more slowly than C_2H_2 since it shows stronger solvation in aq. soln. and is therefore more slowly taken up by the lipid phase of the cell. These facts taken together account for the greater effect of C_2H_2 on both bottom and top yeast. In contrast to its lower homolog, the action of C_6H_{10} is practically independent of the time factor. The velocity with which it diffuses into the cell is extremely small; nevertheless it does penetrate causing a permeability increase, which, however, is obscured by the external narcosis produced by the adsorption layer. Treatment of yeast maceration juice with C_2H_2 or C_2H_4 results in increased surface tension and decreased viscosity. This phenomenon represents a phys. adsorption on the lyophil-colloidal particles, and exerts an inhibiting as well as a protective action. The possibility of almost completely suppressing the activity of enzyme solns. by these substances leads to the inference that the enzymes present in the living cell may also undergo inhibition without actual injury to the cell. **IV. Enzymic processes in germinating barley.** *Ibid.* 218-25. The influence of C_2H_2 and C_2H_4 on germinating barley is similar to that observed with yeast. The germs increase somewhat more rapidly in length; the diastatic power develops at a higher rate and the liberation of amino acids reaches a greater max. In the first few days the yield of green malt is somewhat higher in the control, but after the 10th day the treated seedlings show a smaller loss on drying. These effects are greater with C_2H_2 than with C_2H_4 . There is no evidence of any chem. reaction with the adsorbed gas. The effects are attributed to an increased permeability of the cells. The green malt when dried and stored in the absence of air develops $AcOEt$; this is due probably to a mutase which brings about a Cannizzaro reaction of the AcH and a lipase which esterifies the products.

A. W. DOX

Aging of hydroxyhemin on drying. A. HAMSÍK. *Z. physiol. Chem.* 183, 269-72 (1929).—Freshly prepd. hydroxyhemin while still moist reacts readily with 80% CH_2O_2 to yield crystals of the formyl deriv. After drying several days in the air the same hydroxyhemin preps. react much less readily. The activity may be restored by dissolving in MeOH contg. KOH and acidifying. The loss of activity by simple drying is explained by the formation of anhydride. Pure hydroxyhemin probably exists only in the moist condition.

A. W. DOX

The specificity of peptidases. III. Affinity measurements with animal dipeptidase. ERNST WALDSCHMIDT-LEITZ and GUSTAV V. SCHUCKMANN. *Z. physiol. Chem.* 184, 56-68 (1929); cf. *C. A.* 22, 2381. —For affinity measurements glycyl-L-tyrosine has advantages over glycylglycine in that it is more sol. and shows greater affinity for the enzyme. The cryst. substance should be used, since the amorphous product contains impurities which strongly inhibit the reaction. These measurements were undertaken for the purpose of ascertaining the nature of the influence of H ions on the reaction velocity, and the probable identity of dipeptidase from different sources, e. g., from secretions and from organs. It is shown that the dissocn. of the enzyme-peptide compd. is

strongly influenced by H-ion concn. The form of the activity p_H curve is detd. primarily by the location of equil. between enzyme and substrate, if not by the formation velocity of enzyme-substrate compd., not, however, by the decompn. velocity. A comparison of the affinity of 3 animal dipeptidases, from enteric mucosa, pancreas and spleen, resp., at the p_H optimum of 7.8, gave the same dissoen. const. for all 3, viz., $K_s = 0.0026$. This agreement in affinity points to an identity or at least to a close relationship of the chemically active groups in the enzymes. However, the recent work of Linderstrøm-Lang (C. A. 23, 3718) must be considered, where the existence of 2 dipeptidases appears probable.

A. W. DOX

The cleavage of glycylglycine, alanylglycine and leucylglycine by intestinal and malt peptidases. K. LINDERSTRØM-LANG AND MASAKAZU SATO. *Z. physiol. Chem.* 184, 83-92(1929); cf. C. A. 23, 3718.—Intestinal mucosa contains 2 dipeptidases which differ in their p_H optimum, specificity, stability and behavior toward $Al(OH)_3$. Dipeptidase I has its optimum at p_H 7.3, is very unstable in aq. soln., and hydrolyzes leucylglycine and glycylglycine with about the same velocity. Peptidase II has its p_H optimum at 8.1, is stable in aq. soln. and splits leucylglycine with much greater velocity than glycylglycine. The cleavage of leucylglycine and that of alanylglycine bear the ratio of 1.8 for peptidase I, and of 5.1 for peptidase II at their p_H optima. Two enzyme solns. with equal activity toward leucylglycine may thus show a ratio of 1.40 when tested with alanylglycine. Malt ext. also contains 2 peptidases. The first rapidly undergoes destruction in aq. soln. after removal of proteinase by $Fe(OH)_3$. The aq. soln. when tested was 4 times as active toward leucylglycine as toward alanylglycine and practically inert toward glycylglycine. A glycerol ext. of the same malt, however, retained its peptidase I activity and was therefore a mixt. of I and II. It hydrolyzed alanylglycine twice as rapidly as leucylglycine and gave a distinct cleavage of glycylglycine. The p_H optima for the 2 malt peptidases are 7.8 and 8.6. Malt peptidase II attacks also the tripeptide leucylglycylglycine.

A. W. DOX

Plant proteases. XIV. Proteases of higher plants. OTTO AMBROS AND ANNA HARTENECK. *Z. physiol. Chem.* 184, 93-107(1929); cf. C. A. 23, 2726.—The 2 types of plant proteases, represented by papain which is activated by HCN and pumpkin protease which is inhibited by HCN, occur together in various plants. The gradations observed in activation or inhibition by HCN are due to differences in the relative proportions in which the 2 enzymes are present. Fruit juices which under ordinary exptl. conditions are activated by HCN may suddenly show strong inhibition if the expt. is continued over a longer period. It appears that an enzyme is present which is inhibitable by HCN, but being specific for protein cleavage products its presence is not observed until suitable substrates are provided by the proteinase action. This enzyme is shown to be a dipeptidase, the activity of which is inhibited by HCN. It occurs in all the plants examd. and in all parts of the plant with the exception of the latex. Its p_H optimum for alanylglycine is at 7.6, and it closely resembles the dipeptidase of yeast and of animal intestine. The protease system of plants thus consists of a proteinase (papain) and a dipeptidase; the 1st is activated and the 2nd inhibited by HCN.

A. W. DOX

Experimental demonstration of the law of cytoplasmic sexualization. PH. JOYET-LAVERGNE. *Compt. rend.* 189, 409-12(1929); cf. C. A. 21, 1290, 2001.—The study of the disturbances caused by a deficiency in vitamin B gives a true exptl. demonstration of the law of cytoplasmic sexualization.

LOUISE KELLEY

Crystalline tripeptide from living cells. F. GOWLAND HOPKINS. *Nature* 124, 445(1926).—A cryst. tripeptide contg. glycine, glutamic acid and cysteine has been isolated from cell exts., e. g., from exts. of yeast and red blood corpuscles. The isolation of this pure substance indicates that "glutathione," as previously described by H., is not an individualized substance.

LOUISE KELLEY

Rhythmic sedimentation of erythrocyte suspensions. V. DUCCESCHI. *Kolloid-Z.* 48, 78-9(1929).—When blood serum is treated with an isotonic soln. the red corpuscles coagulate on the walls of the vessel in rhythmic formation. The blood of the dog, man, rabbit, horse, hog and ox was studied. No explanation has as yet been found for this phys. phenomenon.

R. H. LAMBERT

The solution, by the action of neutral salts, of albumin coagulum, with restored ability to be coagulated. R. WILLHEIM. *Kolloid-Z.* 48, 217-31(1929).—Albumin coagulated by heat is redissolved at the boiling temp. by addn. of such salts as $KSCN$, Na salicylate, Na benzoate, etc. On removal of the salt by dialysis the albumin again becomes coagulable. To produce this phenomenon there is necessary a certain min. salt concn. and a quantity of liquid depending on the quantity of coagulum. This is explained by assuming that the solution takes place in 2 phases. The various anions follow the Hofmeister series in their effectiveness. The phenomenon is directly con-

nected with the swelling of the protein. The effect of these salts on viscosity of protein solns. is very small and the change is not a const. increase except at the boiling temp. There a smooth curve results showing a max. due to a change in degree of dispersion of particles. Repeated heating to the b. p. tends to decrease osmotic pressure.

R. H. LAMBERT

Sulfur in proteins. IV. The effect of alkalis upon cystine. ROSS A. GORTNER AND WALTON D. SINCLAIR. *J. Biol. Chem.* 83, 681-96(1929); cf. *C. A.* 21, 3184.—Boiling cystine with 1 or 5% Na_2CO_3 soln. decomposes about $\frac{1}{2}$ the cystine in 24 hrs. In a 6.5% soln. of $\text{Ba}(\text{OH})_2 \cdot 8\text{H}_2\text{O}$ approx. 50% of the cystine is destroyed in 1 hr. of boiling, the N being liberated as NH_3 and the S as sulfide S. After 24 hrs. there still remains approx. 15% of the bound amino N and an equiv. amt of bound S. With 20% NaOH or KOH 83% of the original N is still present as α -amino N after boiling for 24 hrs. These solns. cause rapid and complete removal of the S. Rapid deamination is produced by 6% $\text{Sr}(\text{OH})_2$ soln. and a 5% suspension of $\text{Ca}(\text{OH})_2$. With the latter the deamination reaches 92% in 12 hrs. The rate and extent of deamination does not appear to be a function of the OH-ion concn. of the alk. soln. "There appears to be an intimate relationship between the deamination mechanism and the rate at which S is removed. It is suggested that deamination of cystine in alk. soln. may be assocd. with an oxidation-reduction mechanism and that when all, or nearly all, of the S has been removed then the α -amino groups which still remain become relatively stable. Cystine, or some org. compd. having essentially the same N S ratio as cystine, still persists in the soln. after 24 hrs. of boiling with 6.5% $\text{Ba}(\text{OH})_2$ soln. It is suggested that this 'compd.' may be another 'isomeric' form of cystine, differentiated from it by the fact that it is extremely sol. in H_2O , so sol. in fact as to be hydrosopic." Attempts were made to isolate pure org. compds. from the decompn. products but there is a great complexity of compds. produced which contain "loosely-bound" org. S even after boiling cystine with $\text{Ba}(\text{OH})_2$ soln. for 24 hrs. *l*-Cystine and *i*-cystine are decompd. at the same rate and to the same extent.

A. P. LOTHROP

Studies on lactic acid fermentation of warm-blooded tissues. II. Effect of potassium and calcium ions on the occurrence of extra fermentation of rat salivary gland and liver tissues. OTTO ROSENTHAL. *Biochem. Z.* 211, 295-322(1929); cf. *C. A.* 23, 3241.—Both K and Ca ions produce a similar effect in increasing the lactic acid fermentation of tissues, the extra fermentation under aerobic conditions either not occurring or being considerably reduced in the absence of these ions. The only difference is in the degree of action, the Ca ion having a greater influence than the K ion in the liver but not in the salivary gland tissue.

S. MORGULIS

Studies on the structure of silk fibroin. EMIL ADDERHALDEN AND HANS BROCKMANN. *Biochem. Z.* 211, 395-411(1929)—In a dispersion of silk fibroin in a concd. soln. of LiBr the dispersed particles do not change in size with time. From 6.9 to 8.7% of the dispersed protein passes to the outside fluid in dialysis. Although the fibroin soln. can be pptd. with different concns of $(\text{NH}_4)_2\text{SO}_4$ it was not possible by this method to sep. fractions with specific characteristics. The introduction of benzoyl, *p*-bromobenzoyl or *p*-chlorobenzoyl groups indicating a combination with OH groups proves the existence in the free state of serine and tyrosine in the fibroin mol.

S. MORGULIS

Urine adialyzate. H. PRIBRAM. *Biochem. Z.* 211, 412-9(1929).—Urine is dialyzed in a collodion bag either against H_2O or 0.1 N HCl. The adialyzate (non-dialyzed residue) consists of a ppt. and a water-sol. fraction which can be pptd. with an alc.-ether mixt. (2:1). By repeated soln. and pptn. with alc.-ether mixt. the adialyzate can be prepd. very poor in salt content. The adialyzate corresponding to 16-cc. urine per kg. injected into rabbits produced miosis lasting an hr., while that corresponding to 59-cc. urine caused the animal to lie on its side. The active substance is precipitable through $(\text{NH}_4)_2\text{SO}_4$. Preliminary administration of sugar shortens the action of the adialyzate. On the guinea pig uterus the effect is produced only by very large doses and this is probably due to the salts.

S. MORGULIS

The non-specificity of the proteolytic organ enzymes. K. UTKIN-LYUBOVITZOVA AND O. STREPPUN. *Biochem. Z.* 211, 426-44(1929).—In all tissues of a single species it was found that 3 proteolytic enzymes may be differentiated by their optima at *pH* 3.4, 5.4 and 7.4, resp. The same mixt. of proteolytic enzymes was observed in the rabbit liver. The hypothesis of the specificity of the proteolytic enzymes of organs fails therefore to obtain exptl. corroboration.

S. MORGULIS

The lipolytic activity of saliva. B. KOLDAVEV AND PIKUL. *Biochem. Z.* 212, 53-9(1929).—Saliva from the parotid and submaxillary glands of dogs by means of Pawlow fistulas has definite lipolytic action on synthetic fats as well as on natural fats (olive oil). The lipolytic action of the parotid is greater than that of the submaxillary,

and disappears when the saliva is boiled. The opt. lipolytic activity is at p_H 7.6-7.8, and is independent of the amylolytic activity of the saliva. The lipolytic activity is about the same in saliva obtained through stimulation by various foods, but parotid saliva obtained with dil. HCl does not hydrolyze fat. S. MORGULIS

Tryptoporphyrin. GABRIELE MONASTERIO. *Biochem. Z.* 212, 71-9(1929).—On prolonged digestion in alk. medium with trypsin or pancreatin, hematin is very largely changed to an Fe-free substance with disruption of the mol., in other words into a tryptoporphyrin. A small portion retains its Fe content with great tenacity, and none of the methods for removing Fe from hematin meet with success here. On the contrary, these reagents may actually destroy the bulk of the substance without detaching the Fe, thus leading to the formation of a product nearly as rich in Fe as hemin but not possessing its spectral properties. This suggests that a part of the Fe in hemoglobin must be in loose and a small part in fixed combination. S. MORGULIS

The metabolic effects of mitogenetic radiations. HEINRICH GESENTUS. *Biochem. Z.* 212, 240(1929).—The effect of mitogenetic radiations was studied on *Saccharomyces ellipsoideus* as detector. It was found that their fermentation metabolism was raised 8.8% in 79 expts. An increase was observed in 80% of the tests, a decrease in 1% and in 19% no change occurred. The expts. were made with Warburg's app in a N_2 atm., a 5% glucose soln. of p_H 5.7 being used. The respiratory metabolism under the influence of the mitogenetic radiations was diminished 17% in 75% of the expts. S. MORGULIS

The sulfur content of different serum globulins. ZOLTÁN ASZÓDI. *Biochem. Z.* 212, 102-14(1929).—The S content of globulins from individuals of the same species shows considerable variation. The range of variation found in different subjects was as follows: man 1.06-1.38%; pig 0.97-1.32%; cow 1.17-1.33%; horse 1.03-1.27% and dog 1.17-1.60%. Values above 1.30% are rare in the serum globulin of the various organisms studied except the dog where this is more or less the usual magnitude. S. MORGULIS

The sulfur content of fibrin from different mammals. ZOLTÁN ASZÓDI. *Biochem. Z.* 212, 158-61(1929).—The % of S in fibrin from human blood is 1.28-1.44; from pig 1.07-1.09; cow 1.20-1.27; horse 1.16-1.20 and dog 1.24-1.42. S. MORGULIS

New knowledge of the specificity and mode of action of sugar-splitting enzymes. RUDOLF WEIDENHAGEN. *Z. angew. Chem.* 42, 833-5(1929).—Further discussion (cf. C. A. 23, 3237). CORNELIA T. SNELL

Colloids as regulators of the division energy of cells. G. L. ROHDENBURG. *J. Cancer Research* 13, 242-50(1929).—Colloids of various kinds (aq. suspensions of lecithin, cholesterol, egg albumin, acacia and gelatin) inhibit the division energy of paramaecia to a varying degree when added to hay infusion. H. G. WELLS

Effects of cathode rays on the proteins of serum. LILLIAN E. BAKER AND ROBERT B. COREY. *J. Exptl. Med.* 50, 439-44(1929).—The effects of cathode rays on the proteins of serum appear to be (1) denaturation of a large proportion of the albumin and globulin with the formation of products that are sol. at the p_H of the serum; (2) the production of a tough and exceedingly insol. substance on the window of the cell where most of the absorption of electrons occurs; (3) a slight hydrolytic cleavage of the protein mol. producing a small quantity of products having properties so near those of the protein that they are pptd. by Cl_3CCO_2H but are not removed by coagulation at the isoelectric pt.; (4) the production of a small quantity of hydrolytic products not pptd. by Cl_3CCO_2H and (5) the formation of a small amt. of NH_3 , part of which at least is derived from the $CO(NH_2)_2$ of the serum. These changes are such as would bring about exactly those effects on fibroblasts which were observed when cultures were grown in serum which had been subjected to cathode ray irradiation. C. J. WEST

Cell proliferation response to sulfhydryl in mammals. F. S. HAMMETT AND S. P. REIMANN. *J. Exptl. Med.* 50, 445-8(1929).—Studies with thioglucose establish that the SH group is stimulative of cell proliferation in mammals as in the lower organisms. The fact that the stimulation is exhibited in such a wide diversity of species including both plants and animals is justification for the belief that it is the expression of a fundamental biol. phenomenon. C. J. WEST

The problem of pigment formation. BRUNO BLOCH. *Am. J. Med. Sci.* 177, 609-18(1929).—The specific dopa reaction is pos. in the melanoblasts of higher vertebrates. There is a time, place and intensity parallelism between the reaction and the formation of pigment. The agent within the cells which is responsible for the reaction has the characteristics of an oxidizing enzyme and is concluded to be identical with the natural pigment producing oxidase, thus being called dopa oxidase. The mother sub-

stances of melanogens is indefinite but it is indicated that pyrocatechin derivs. play a role in the formation of natural pigment. R. C. WILLSON

The nomenclature of lipides (VESELÝ, JAKŠ, 2). The relation between the sizes of ions and the salting-out of hydroquinone and quinone (LINDERSTRØM-LANG, 2). Wo. Ostwald's "solid-phase rule" and the solubility of casein in NaOH (SØRENSEN, SLÁDEK, 2). Dielectric polarization of ovalbumin solutions (GARREAU, MARINESCO, 2).

B--METHODS AND APPARATUS

STANLEY R. BENEDICT

Nuclear staining in the dry blood preparation. G. C. VAN WALSEM. *Nederland. Tijdschr. Geneeskunde* 73, I, 532-5(1929). W. recommends a special method of fixation of blood preps., using CH_3OH and CHCl_3 and 1.66% Azure 1 + 10% NaOH for staining. R. BEUTNER

The cleaning of glassware used for morphological blood examination. G. C. VAN WALSEM. *Nederland. Tijdschr. Geneeskunde* 73, II, 3258-60(1929). W. recommends Br_2 dissolved in NaOH. R. BEUTNER

The unreliability of Nylander's reaction in a strongly acid urine. W. HOOGLAAG. *Nederland. Tijdschr. Geneeskunde* 73, II, 1377(1929). KOH must be added to acid urine for detecting sugar by Nylander's reagent. R. BEUTNER

Practical experience with potentiometric and colorimetric pH methods in serum. H. SCHREUS AND K. SCHULZE. *Z. ges. exp. Med.* 64, 540-52(1929). F. L. DUNN

The use of tungstomolybdic acid as a precipitant for blood proteins. STANLEY R. BENEDICT AND ELEANOR B. NEWTON. *J. Biol. Chem.* 83, 357-60(1929); cf. C. A. 23, 2733. A protein precipitant is described which does not cause the loss of any non-protein constituents and which thus permits the quantitative recovery of thionine and glutathione from blood. It is prepd. and used as follows: 10 g. of pure, NH_4 free molybdic acid is treated in a flask with 50 cc. of N NaOH and the mixt. boiled for 1 to 2 min. A practically clear soln. should result. About 150 cc. of H_2O is added and the cooled soln. is mixed with a soln. of 80 g. Na_2WO_4 dissolved in about 600 cc. H_2O . This mixed soln. is dild. to 1:1. The acid employed during the pptn. is 0.62 $\text{N H}_2\text{SO}_4$, prepd. by dild. 620 cc. of N acid to 1:1. The pptn. of blood proteins is carried out as in the familiar tungstic acid pptn. ARTHUR GROLLMAN

Studies on the non-sugar reducing substances of the blood and urine. 1. Glutathione and thionine in blood. STANLEY R. BENEDICT AND ELEANOR B. NEWTON. *J. Biol. Chem.* 83, 361-5(1929). A procedure is described for isolating glutathione from sheep blood which is superior to yeast for this purpose. Glutathione is responsible for a large proportion of the non-sugar reduction yielded by blood. A. G.

A simple determination of acetoacetic acid in urine. J. MILKA AND F. KLEIN. *Bratislav. Lekárske Listy* 8, 188-92(1928). The acetoacetic acid in 5 cc. urine is decompd. by the addn. of 12 drops of $\text{N H}_2\text{SO}_4$ and heating in a water bath for 15 min. After cooling and making alk. with NaOH, FeCl_3 soln. is added and sufficient 1% soln. of acetoacetic acid to give a color reaction of the same intensity as that obtained from the original sample of urine. The amt. of acetoacetic acid added is equal to that originally present. WILLIAM J. HUSA

Basic amino acids. The estimation of the basic amino acids in small amounts of casein and edestin by the modified method of Vickery and Leavenworth and other methods. H. O. CALVERY. *J. Biol. Chem.* 83, 631-48(1929). The modified method of Vickery and Leavenworth for the estn. of the basic amino acids of protein (C. A. 22, 1606) has been further modified for use on small quantities of protein. Very consistent results have been obtained when casein and edestin were analyzed by this modification. The histidine and arginine contents of casein were also estd. by other methods for comparison. The total N of the arginine fraction is not a true indication of the amt. present. The alk. hydrolysis method of Van Slyke (C. A. 6, 236) is probably a true indication and the isolation method gives values which correspond to those obtained by alk. hydrolysis. The colorimetric method of Hanke and Koesler (C. A. 14, 3687) and the bromination method of Plimmer and Phillips (C. A. 18, 2015) give values which agree well with those obtained for the total N of the histidine fraction. The latter method is accurate only under very special conditions and is influenced especially by temp. and also by the acid concn., and the length of time of bromination and there are several interfering substances. The soly. of the Hg compd. of histidine is markedly influenced by acid concn., since it will not ppt. from an H_2SO_4 soln. more concd. than 13% by wt., it is almost quantitatively pptd. when the acid concn. is between 3 and 5%. A. P. LOTROP

The determination of p_H and carbon dioxide on a single small sample of blood plasma or serum. ALFRED T. SHOHL. *J. Biol. Chem.* 83, 759-63(1929).—When economy of blood is necessary, the method described allows a detn. of both the CO_2 and p_H on 0.1 to 0.2 cc. of blood serum or plasma. The p_H is measured colorimetrically in 0.9% NaCl and the material is then transferred without exposure to air to the Van Slyke gas app. for the detn. of CO_2 . A. P. LOTHROP

A micro electrode and vessel for the determination of the hydrogen-ion concentration of blood media, whole blood and other biological fluids. A. J. SALLE. *J. Biol. Chem.* 83, 765-72(1929).—The micro electrode and vessel described for the detn. of the H-ion concn. of blood and other biol. fluids is so constructed that a min. of contact is automatically obtained between the fluid and electrode. With the aid of a push button operated by the foot, readings are practically instantaneous before there is any appreciable loss in the concn. of CO_2 and O_2 . The results agree very closely with those obtained with the colorimetric method. A. P. LOTHROP

The modern methods of bilirubimetry in blood. NOEL FIESSINGER AND HENRY WALTER. *Ann. méd.* 23, 178-201(1928). The methods of different authors for detn. of bilirubin in blood are described, criticized and the indications for the detn. are explained. A. E. MEYER

A protein sulfuric acid ester in the liver. SIGMUND FRÄNKEL AND GABRIELE MONASTERIO. *Biochem. Z.* 211, 264-9(1929). Freshly pulped liver is rubbed up with an equal wt. of H_2O and 40 cc. N AcOH, filtered or centrifuged, and the ext. warmed to 60-70°. The cooled filtrate is pptd. with CCl_3CO_2H until a turbidity is no longer formed and then filtered. The filtrate is neutralized with $PbCO_3$, condensed *in vacuo* and freed of Pb with H_2S . The H_2S is driven off by CO_2 and the filtrate is pptd. with double the vol. of alc. The filtrate is reduced to a small vol. *in vacuo* and dialyzed against H_2O until the H_2O no longer gives a test for acid. The non-dialyzed residue is very much concd., pptd. with twice the vol. of alc. and the filtrate, again reduced to small vol. *in vacuo*, is once more pptd. with an excess of alc. A white powder is pptd. which is washed with 95% and then with abs. alc., finally with ether, and dried *in vacuo*. S. M.

Determination of creatine and creatinine in small quantities of blood. E. KOPLOWITZ. *Biochem. Z.* 211, 475-86(1929). Serum or laked whole blood is deproteinized with CCl_3CO_2H and centrifuged. To an aliquot portion of the clear soln. a drop of p -nitrophenol and a few drops of 33% NaOH are added until yellow color appears. For the creatine detn. the soln. (- 1 cc. serum, or 0.83 cc. blood) is treated with enough 6 N HCl to give a final concn. of 2 N and this is left for 24 hrs. at 60-65°, when all the creatine is converted to creatinine. The creatinine is detd. colorimetrically by adding 5 cc. of a mixt. of 25 cc. satd. picric acid with 10 cc. 3% NaOH, and matching the color after letting it stand 30 min. No difference was found in the creatine or creatinine content of venous and arterial bloods. S. MORGULIS

Microchemical determination of calcium in serum and plasma. B. GROÁK. *Biochem. Z.* 212, 47-52(1929). By modifying the detn. of CaC_2O_4 into an iodometric titration the accuracy of the method has been extended to 0.0002 mg. Ca. A tenth of a cc. of blood is measured by means of a capillary pipet into a small tube, the pipet is rinsed with 0.1 cc. H_2O and finally 0.3 cc. $(NH_4)_2C_2O_4$ is added and the tubes are left for 2 hrs. After centrifuging 15-20 min. the liquid is removed by means of a siphon and the ppt. is washed 3 times with 0.5 cc. 2% NH_4OH and centrifuged 2-3 min. To the ppt. is added 0.2 cc. 20% H_2SO_4 and this is heated in boiling water. One cc. 0.002 N $KMnO_4$ accurately measured is introduced into the tube and after 2-3 min. cooled. Now 0.1 cc. 10% KI and 1 drop starch soln. are added and the liberated I_2 is titrated with 0.001 N $Na_2S_2O_3$, one cc. of which corresponds to 0.02 mg. Ca. In the calcn. of the results the $\{[cc. Na_2S_2O_3 \text{ of the blank}] - [cc. Na_2S_2O_3 \text{ in analysis}]\} \times Na_2S_2O_3 \text{ factor} \times 20 = \text{mg. } \% \text{ Ca.}$ S. MORGULIS

The so-called vitamin A reactions. GABRIELE MONASTERIO. *Biochem. Z.* 212, 66-70(1929). Cod-liver oil gives pos. tests with $AsCl_3$, $SbCl_3$, P_2O_5 , H_2SO_4 , pyrogallol and resorcinol. The residue from an alc. ext. of cod-liver oil gives a pos. pyrogallol and resorcinol test, doubtful test with $AsCl_3$ and all other tests neg. The cod-liver oil after the alc. extn. gives strong reactions with all tests. After heating the cod-liver oil in an air stream at 150°, which destroys its biol. action, all the reactions disappear except the pyrogallol and the resorcinol tests which still remain strongly pos. S. MORGULIS

A simple apparatus for the determination of the alkali reserve of the blood. MAX SCHLESINGER. *Biochem. Z.* 212, 115-26(1929).—The app. consists of a vessel 6×13 cm. which communicates with a 25 cm. calibrated capillary tube of 0.02-0.03 sq. cm. cross section. The cross section is detd. by weighing the Hg corresponding to 1 cm. and multiplying this by the factor of sp. vol. at 20° (0.0738). The open end of the vessel

can be closed by means of a ground-glass plate. A drop of octyl alc., 0.8-cc. H_2O and 0.5-cc. paraffin oil are introduced into the vessel and 1-cc. plasma is measured under the surface of the liquid, followed by 0.2 cc. 6 vol. % H_2SO_4 , and the vessel is closed. As soon as the Hg in the capillary ceases to rise a reading is taken and the app. is shaken for several min. and the height of the capillary column is again read. The difference multiplied by the vessel constant for the temp. of the expt. gives the total CO_2 in 100 cc. plasma. Tables for the calcn. are given. The results agree very well with those obtained by means of the Van Slyke method. S. MORGULIS

The physico-chemical conditions for the disinfection of urine. J. KLERBERG. *Zentr. Bakt. Parasitenk.*, I Abt., 112, 382-5(1929).—Urotropine at a diln. of 1:500 inhibited growth below a p_H of 6.9, and helmitol below 7.3. JOHN T. MYERS

A new chart illustrating results in the analyses of urines. J. DÉCADE. *J. pharm. chim.* [8], 9, 259-60(1929).—See C. A. 23, 4958. S. W.

X-ray contrast media. BERNARD FANTUS. *J. Am. Pharm. Assoc.* 18, 231-7(1929).—A discussion of present knowledge with reference to diagnostic value in medicine. L. E. WARREN

Spectrographic chemical analysis (RAMAGE) 7.

C—BACTERIOLOGY

CHARLES B. MORREY

A systematic study of some torulae. F. C. HARRISON. *Trans. Roy. Soc. Can.* 22, Sect. V, 187-225(1928).—H. gives a systematic study of a large number of torulae, including their actions on mono- and disaccharides, milk and other substrates. A. T. CAMERON

A study of some types of bacteria which produce a "caramel" flavor in milk. C. D. KELLY. *Trans. Roy. Soc. Can.* 22, Sect. V, 227-32(1928).—Four strains of bacteria were isolated from samples of milk rejected at a large British Columbia milk plant for having a cooked flavor. These are temporarily classified as variants of *Streptococcus lactis*. A. T. CAMERON

Fermentation and growth in dried yeast cells. II. CHR. BARTHEL, H. v. EULER AND K. MYRBÄCK. *Z. physiol. Chem.* 183, 237-43(1929); cf. C. A. 21, 597.—An air-dried bottom yeast which had retained 65% of the fermenting power of the fresh yeast from which it was prepd. was subjected to further treatment with H_2O , H_2O and CH_3Cl , and then allowed to ferment sterile beerwort to which had been added 4% glucose and small quantities of phosphate and zymophosphate. Counts were made of the total no. of cells and of the no. of living cells as represented by colonies developed on wort-agar plates, both at the beginning and at the end of the expt. During the 48-hr. fermentation the proportion of living cells had increased from 1/140,000 to 1/11,500, an entirely normal increase. The yield of CO_2 was 65% of that produced by the original fresh yeast. Calcd. from these data, the fermentation attributable to living cells would be 1/90,000 of the total at the beginning and 1/7500 at the end of the expt. More than 99.98% of the fermentation caused by this highly active dried yeast must therefore have been due to cells incapable of reproduction. A. W. DOX

Physiological characteristics shown by *Sterigmatocystis nigra* in the absence of zinc and iron. MARIN MOLLIARD. *Compt. rend.* 189, 417-20(1929).—From his expts. M. concludes that either it is impossible by the method used, to remove all the Fe and Zn from the medium, or these metals are not absolutely indispensable in the development of *Sterigmatocystis nigra*, their absence merely modifying the rapidity of the nutritive change. LOUISE KELLEY

The cytology and microchemistry of *Mycobacterium tuberculosis*. GEORGES KNAYSI. *J. Infectious Diseases* 45, 13-33(1929).—A microchem. study of young tubercle bacilli does not substantiate the assumption of a wax or fat sheath around the cell of the tubercle bacillus, or of wax or fat granules inside the cell. The literature on the chemistry and structure of the tubercle bacillus is reviewed. JULIAN H. LEWIS

Pathogenicity and proteolytic action of typhoid bacilli. J. WEISSFELDER. *Z. Immunitäts.* 58, 193-201(1928).—Typhoid bacilli possess an enzyme which can digest blood serum. The toxic substances which are present in typhoid culture fluids are apparently disintegration products of protein. Toxic substances are found in the blood, urine and serous fluids of typhoid patients and infected animals which arise from the proteins of the body and are identical in their action to the toxic material in culture fluids. Animals immunized against typhoid bacilli are nevertheless sensitive to this toxic action. Various strains of typhoid bacilli can be distinguished by their proteolytic strength and the stronger the proteolytic action the more virulent they are. J. H. L.

The morphology and biochemistry of the variants of proteus X 19 and its toxin. M. STUTZER. *Z. Immunitäts.* 58, 202-21(1928).—The O and H forms of the proteus bacillus X 19 can be differentiated by their metabolism, their toxic action and immunologically.

JULIAN H. LEWIS

The toxicity of mannitol-fermenting dysentery bacilli. A. DE ASSIS. *Z. Immunitäts.* 58, 343-53(1928).—Filtrates of bouillon cultures and autolyzates of Y-dysentery bacilli were not toxic for white mice, although the dried bacteria and the concd. fluid in which the organisms were heated were toxic. Neither normal nor immune horse serum neutralized this toxic effect. Toxicity of Y-dysentery bacilli, therefore, depends on a substance arising from the bacterial substance and is not a true toxin.

JULIAN H. LEWIS

The biology of the staphylococcus. HANS GROSS. *Z. Immunitäts.* 59, 510-6 (1928).—The most important products of staphylococcus growth are a hemolysin, leucotoxin, a tryptic enzyme, gelatinase, a rennin and staphylokinase. Certain strains of pyocyanus produce a toxin which can be demonstrated by intracutaneous injection into rabbits and guinea pigs.

JULIAN H. LEWIS

The chemical study of bacteria. XXIX. A proximate analysis of a defatted residue of avian tubercle bacilli. ALICE G. RENFREW. *J. Biol. Chem.* 83, 569-77(1929); cf. *C. A.* 23, 407.—The defatted avian residue has been subjected to extn. with H₂O, NaCl soln. and 0.5% NaOH and protein and carbohydrate material comparable to that already isolated from the human strain together with certain lipid fractions and the protein extd. by 0.5% NaOH have been isolated for biol. testing. The yields of the carbohydrate and of the alk.-sol. protein are low in comparison with similar fractions from the human strain. Further quantities of a waxy lipid have been obtained from avian and human strains after acid treatment of residues which had previously been thoroughly extd. with fat solvents.

A. P. LOTHROP

Luminous bacteria. SAMUEL E. HILL AND CHARLES S. SHOUP. *J. Bact.* 18, 95-9(1929).—Luminous bacteria grow and luminesce best on alk. media, pH 8.0. BaCO₃ is toxic and MgCO₃ apparently stimulating to them. They do not produce indole. They liquefy gelatin. They produce acid from glycerol and dextrose but luminesce very little on dextrose. No growth or luminescence occurs in the presence of pure H but they regain this power after being thus sealed for 14 months. Similar results occur with pure N, luminescence being regained after 12 months.

JOHN T. MYERS

The fermentation of glucuronic acid by certain bacteria. ARMAND J. QUICK AND MORTON C. KAHN. *J. Bact.* 18, 133-7(1929).—The members of the colon-typhoid-dysentery group can utilize glucuronic acid as a source of energy. Four strains of *Staphylococcus aureus* did not use it, and one strain of *Staph. albus* fermented it. Most anaerobic spore formers can utilize it if they ferment glucose, but less energetically; and also a few strains which do not ferment glucose. Much work remains to be done before it can be used for identification.

JOHN T. MYERS

The specificity of scarlatinal hemolytic streptococci, with special reference to the formation of rash-developing substances. GEORGE MORIWAKI. *J. Bact.* 18, 139-56 (1929).—Injections of toxins of non-scarlatinal hemolytic streptococci in a pos. reactor can turn Dick's skin reaction to neg. Scarlatinal streptococci are those strains of hemolytic streptococci which have a stronger tendency to develop rash in the human, and stronger antigens for the blanching phenomenon.

JOHN T. MYERS

The influence of *Azotobacter chroococcum* upon the physiological activities of cellulose destroyers. J. R. SANBORN AND W. B. HAMILTON. *J. Bact.* 18, 169-73 (1929).—*Azotobacter* produces a gum which is a carbohydrate, levorotatory, and not readily hydrolyzed by boiling with acid. It contains a trace of combined N. Under certain conditions *Azotobacter* assumes a form in which the cell membrane assumes a diffuent or mucilaginous character. *Azotobacter* gum may aid the action of cellulose destroyers.

JOHN T. MYERS

Bile blood agar as a differential medium for streptococci. D. E. BELENKY AND N. Y. POPOVA. *Zentr. Bakt. Parasitenk.*, I Abt., 113, 22-7(1929).—The method is useful.

JOHN T. MYERS

The morphological and biochemical changes in *Bact. lepra* Kedrowski under the influence of radium emanation. ANNA ZOLKEVICH. *Zentr. Bakt. Parasitenk.*, I Abt., 113, 67-71(1929).

JOHN T. MYERS

The influence of oxygen on form and motility of the cholera vibrio. M. VAN RIEMSDIJK. *Zentr. Bakt. Parasitenk.*, I Abt., 113, 161-89(1929).—Hanging drops from the surface scum of a 24 hr. cholera vibrio culture were compared with drops made from the depths away from O, for 20 days. Those from the surface were shorter and plumper;

they lose their motility, autoagglutinate and develop involution forms much more quickly. JOHN T. MYERS

The influence of capillary-active substances on the growth of the tubercle bacillus. L. MODEL. *Zentr. Bakt. Parasitenk.*, 1 Abt., 113, 214-9(1929) — Capillary-active substances are those which decrease surface tension. The ratio of inactive suspensoids to such substances gives a quotient which expresses at least a factor in the dynamics of infection. JOHN T. MYERS

The Gram-positive character of pneumococci and diphtheria bacilli. W. WILKE. *Zentr. Bakt. Parasitenk.*, 1 Abt., 113, 262-6(1929). — Sp. immune serum has no effect on the Gram-positive character of these organisms, nor does the action of pepsin or trypsin. JOHN T. MYERS

Is sulfuric acid or antiformin preferable in the isolation of the tubercle bacillus? KENTARA HARADA. *Zentr. Bakt. Parasitenk.*, 1 Abt., 113, 266-70(1929). — There is little difference in the 2 methods. JOHN T. MYERS

The biology of the paratyphoid bacillus (behavior in glycerol-fuchsin bouillon, rhamnose solution, and in ammonium chloride-rhamnose solution). FR. HILL. *Zentr. Bakt. Parasitenk.*, 1 Abt., 113, 348-52(1929) JOHN T. MYERS

A new enrichment method for typhoid and paratyphoid bacilli in water and feces. FRIEDRICH HODER. *Zentr. Bakt. Parasitenk.*, 1 Abt., 113, 353-7(1929); cf. C. A. 22, 4144. — A stock soln. of malachite green of 1:250 and of brilliant green 1:200 was used. Mix 38.5 cc. of sterile water, 5 cc. of sterile bile and 5 cc. of bouillon, and add the material to be examd. Add 0.8 cc. of stock malachite and 0.1 cc. of brilliant green, drop by drop. Incubate 3 hrs. and add 0.45 cc. of malachite and 0.15 cc. of brilliant green and continue the incubation. The modification is very satisfactory. JOHN T. MYERS

The influence of the hydrogen-ion concentration and salt content of media on the serological and cultural characteristics of the colon-typhoid, proteus and dysentery groups. LEO OLITZKI. *Zentr. Bakt. Parasitenk.*, 1 Abt., 113, 395-403(1929) — For *B. typhosus* the optimal H-ion conditions for antigenic function development are slightly acid, for *B. proteus*, slightly alk. and for *B. paratyphosus*, neutral. The stable antigen for typhoid and dysentery strains develops somewhat better on a slightly acid, salt-poor medium. JOHN T. MYERS

Observations on species-selective actions. FRIEDRICH BOAS. *Zentr. Bakt. Parasitenk.*, 11 Abt., 78, 21-40(1929) — This is a detailed study of the selective effects of various org. and inorg. mols., anions and cations on various microorganisms. JOHN T. MYERS

Certain acid-tolerant bacteria causing spoilage in canned foods. C. T. TOWNSEND. *Zentr. Bakt. Parasitenk.*, 11 Abt., 78, 161-72(1929) — All the organisms isolated were predominantly saccharolytic, with only slight proteolytic powers. All were very acid-tolerant, and would not be inhibited in any canned food by acidity alone. They are not heat-resistant and spoilage due to non-sporeforming coccoid bacilli seems due to gross under-sterilization. JOHN T. MYERS

Pigment formation as a differential character of microorganisms. N. DMITREVSKY. *Zentr. Bakt. Parasitenk.*, 11 Abt., 78, 352-4(1929) — The amt. and character of the pigment varies with compn. of the medium, O tension and temp. Pigment is especially important in the differentiation of the mesentericus group. JOHN T. MYERS

Cellulose-destroying bacteria. STANISLAUS ŚNIESZKO. *Zentr. Bakt. Parasitenk.*, 11 Abt., 78, 375-80(1929) — Aerobic organisms were isolated which produced clear zones in cellulose media contg. CaCO_3 and buffered with K_2HPO_4 . This supports the contention that such clearing is due to enzyme action rather than to the soln. of CaCO_3 by acids produced during fermentation. JOHN T. MYERS

Questions at issue in iron bacteria investigations. EINAR NAUMANN. *Zentr. Bakt. Parasitenk.*, 11 Abt., 78, 380-4(1929). JOHN T. MYERS

Effect of alcohol upon the lytic principle of d'Herelle. S. RACCHUSA. *Boll. soc. ital. biol. sper.* 4, 549-50(1929). — Added to active bacteriophage, alc. in a concn. of 1:10 causes an attenuation, and finally an apparent destruction of the active principle. Contact for from 24 to 68 hrs. at room temp. causes little if any weakening; exposure for 10 days is more effective but activity becomes evident with the second passage; after contact for 15 days the questionable lysis observed in the first passages cannot be enhanced. G. H. SMITH

Method for testing antiseptic dyes. GEO. F. REDDISH. *J. Am. Pharm. Assoc.* 18, 237-40(1929). — The method was devised by C. L. Himebaugh but unpublished. *Staphylococcus aureus* of normal resistance is grown at 37° in broth and transferred for 3 consecutive days. 0.1 cc. of a $1/100$ diln. of this culture is added to 15 cc. of melted serum-agar (10% blood serum in nutrient agar contg. 1.5% agar), the mixt. cooled to

45°, the culture thoroughly mixed in the serum agar and the mixt. poured into a Petri dish. A glass stopper or vial is placed in the agar until the agar is cooled. The stopper or vial is removed, leaving a cup in the agar. Enough of the antiseptic dye soln. is added almost to fill the cup. If the substance permeates into the agar medium sub-cultures are taken to demonstrate antiseptic action.

L. E. WARREN

Studies on the effect of ultra-violet rays upon the bacteriophage and its physico-chemical nature. KAORU MIZUNO. *Japanese J. Med. Sciences*, VI. *Bacteriology and Parasitology* 1, 52-87(1929).—The bacteriophage is destroyed by ultra-violet rays. The destructive action of ultra-violet rays varies according to the physicochem. status of the medium. It is weak in broth, moderate in H₂O and strongest on agar plates. The bacteriophage is not volatile; its absorption of ultra-violet rays is strong; it is difficult to dialyze; and it may be considered that the bacteriophage is a colloidal substance. Viscosity of broth which contains the bacteriophage is higher than that of normal broth. The bacteriophage lowers the surface tension of the medium. Its dispersion is much weakened by exposure to ultra-violet rays and easily changeable by the addn. of an acid and therefore it must be a sensitive colloid. The bacteriophage is made turbid more rapidly and strongly than the broth by the addn. of an acid, which fact distinguishes the colloidal nature of the bacteriophage from that of the control broth. The bacteriophage is apparently a colloid with a high elec. cond., so that it must be an ionized substance. The bacteriophage is not destroyed by x-rays. From these facts and other mechanisms concerning d'Hérelle's phenomenon the bacteriophage seems to be a fermentative colloidal substance.

H. G. WELLS

Differentiation of hemolytic streptococci of human and of dairy origin by methylene blue tolerance and final acidity. ROY C. AVERY. *J. Exptl. Med.* 50, 463-9(1929).—A grouping of 138 strains of hemolytic streptococci based on differences in dye-sensitivity and in final H-ion concn. of cultures is presented. Three groups are distinguished: human parasitic strains, defined by a final p_H range of 5.2 to 5.0 and by failure to reduce methylene blue (1:5000) in milk; bovine strains parasitic in the udder, characterized by a final p_H of 4.5 to 4.2 and by failure to reduce the dye; saprophytic strains, characterized by a final p_H range of 4.5 to 4.2 and by ability to reduce the dye. Methylene blue was bactericidal for the strains of hemolytic streptococci that fail to reduce it but neither bacteriostatic nor bactericidal for the strains that caused its reduction. C. J. WEST

Bacteria that survive and grow during the pasteurization of milk and their relation to bacterial counts (PRICKETT, BREED) 12.

THOMAS G. PHILLIPS

The bases for the stimulation of higher plants. ANNELIESE NIETHAMMER. *Z. Pflanzenernähr. Düngung u. Bodenk.* 14A, 162-9(1929).—A microchem. study of the germinating wheat seeds subjected to the action of a no. of stimulating agents was made by the application of sensitive reagents suitable for testing the presence of the different stimulants in the swelling seed. CuSO₄, MgSO₄, uspulun, uspulun universal, K₂SO₄, KSCN and ZnSO₄ were the stimulants used in appropriate concns. It is shown that with a significant effect of the stimulating agents on the germination and development of wheat seedlings there is not correlated a general entrance of the stimulating agent into the seed. The sterilizing action of a no. of the stimulants is emphasized as a possible explanation of the action. The stimulating action of certain chemicals on fungi and bacteria with semipermeable membranes is cited as true stimulating action. The action of certain stimulants on seeds having semipermeable membranes is considered a positive action while the apparent or passing stimulating action of other stimulants on harder seeds must be considered as indirect.

R. M. BARNETTE

Experiments on the action of dark and light periods on the root nutrition of plants. M. K. DOMONTOVICH AND A. I. GROSHENKOV. *Z. Pflanzenernähr. Düngung u. Bodenk.* 14A, 194-205(1929). Water cultures with oats, corn, sunflowers and cucumbers were carried out in such a manner that the quantity of light was varied as well as the nutrient soln. available to the plant. Conclusions: In periodic N nutrition, the production of dry matter of plants was significantly lower than an unbroken N nutrition. (NH₄)₂SO₄ showed a greater yield of leaves, stems and roots than NaNO₃. Light had a stronger action on development and dry substance production of plants which received NO₃ than those which received NH₄. The absorption of nitrate N was much more significantly increased by light than the absorption of NH₄. The proportion of root development to total development was lower for NH₄ nutrition as compared to NO₃ nutrition. The reduction of the root system cannot be considered as a toxic action of the NH₄ salt.

The roots of plants subjected to periodic contact with solns. of $(\text{NH}_4)_2\text{SO}_4$ showed the property of being able to impart an acid reaction to solns. without $(\text{NH}_4)_2\text{SO}_4$ when removed to such solns. Periodic nutrition with P_2O_5 showed no tendency to reduce the level of dry matter production of the plants. Light had a definite though weak positive influence on the effect of the P_2O_5 nutrition and also on the absorption of P_2O_5 from the solns. Periodic K supply was not sufficiently large to cover the requirements of the plants for K. Light had little if any effect upon the K nutrition. By periodic supply of Ca the plants were almost completely killed. For most of the elements there was a positive light action, i. e., an increase for the effect on the plant. The difference of the action of light on the absorption of the different elements by the plant can be considered relatively speaking as independent of the processes of absorption, the intensity of transpiration, etc.

R M BARNETTE

Physiology of urea in the higher plants. G. KLEIN. *Z. Pflanzenernähr. Düngung* 12A, 390-1(1928).—Urea is present in plants in max. amts. in seedlings, young buds and leaves, and in active tissue. In old leaves and seeds none occurs. Urea in a nutrient medium for plants is partially decomposed outside the plant roots and partially absorbed and decomposed within the plant tissue, and the plant may be poisoned by the NH_3 produced. Urea in young plant tissue is to a large extent combined with aldehydes.

B C. A.

Secondary products in the extraction of glutamine from beets. C. RAVENNA AND R. NUCCORINI. *Boll. inst. agr. Pisa* 4, 149-55(1928).—In the extrn. of glutamine (cf. C. A. 23, 3667), the beet ext. is defecated with Pb acetate, and the ppt. decomposed with H_2S . The filtrate is neutralized with NH_4OH and after crvstn. of glutamine, isoleucine was isolated from the residual soln., as found by Ehrlich in molasses (*Ber* 38, 1809(1905)). It is probable that isoleucine preexists free in the beets. **The disappearance of glutamine and formation of allantoin in beets.** *Ibid* 159-63.—In the beets during the period of utilization of the reserve materials, the glutamine decreases and increases the allantoin; while during the accumulation of the reserve materials there is an opposite phenomenon. Allantoin was found by Smolenski (C. A. 6, 2862) only in the Russian beets. It is suggested that allantoin is formed by metabolism of purine comds. and that its disappearance is due to oxidation processes. **Several compounds derived from ammonium α -hydroxyglutarate.** *Ibid* 167-78. See C. A. 23, 3667. **The significance of the glutamine in castor beans during germination.** R. NUCCORINI (WITH D. TABB). *Ibid* 453-62.—In germinating castor beans glutamine is present in less quantity than glutamic acid in dormant seeds. Glutamine is due to hydrolysis of glutamic acid, and this to decompn. processes of proteins, while asparagine is a synthetic compd. utilized in the regeneration of protein substances.

G A BRAVO

The relation between some constituents of fruit juice and the keeping quality of the fruit at low temperature. G. LEONCINI AND G. LEVI. *Boll. inst. agr. Pisa* 4, 505-15(1928).—Four varieties of peaches were examd., viz. "Victor," "Elberta," "Mayflowers" and "H-Beauty," that keep at 2° without changes, resp. for 42, 39, 38 and 28 days. Analysis of the juice at the beginning of the expts. gave, resp.: moisture 85.92, 86.57, 83.76, 88.32; ash 0.61, 0.52, 0.66, 0.62; sucrose 1.20, 1.11, 1.00, 1.17; *d*-glucose 0.57, 0.49, 0.32, 1.08; fructose 1.77, 1.67, 1.60, 2.14; malic acid 1.737, 1.436, 1.286, 1.396; citric acid 0.070, 0.052, 0.047, 0.041%. During the conservation, the sugars and acids decrease; but in the varieties that keep less well at low temp. sugar decrease is high and acid (chiefly malic acid) decrease is very little.

G A BRAVO

Researches on the fluorescent substances of the plants and on some photolysis phenomena. L. PETRI AND M. DE CRECO. *Boll. staz. patol. veget.* [N. S.] 8, 374-406(1928).—Of exts. of 164 plants examd., 150 contain one or more substances that become fluorescent under the action of ultra-violet rays. These fluorescent substances are glucosides, phloroglucinol tannins or plant pigments. Generally the most dangerous photolytic changes occur in the plants plentifully provided with fluorescent substances. No relation was found between the occurrence of fluorescent substances in the plant and their systematic classification or the sensibility to the light of phototropic plants.

G. A. BRAVO

Effect of the uranium rays and of the ionization of air on the olive tree. LIONELLO PETRI. *Boll. staz. patol. veget.* [N. S.] 9, 93-4(1929).—The normal growth of the olive tree is inhibited by rays from U_3O_8 ; the leaves of treated plants are smaller and provided with star-like hairs on the epidermis. The water absorbed from the treated plants is about 50% of that absorbed from the olive tree under normal conditions. On eliminating the noxious action of rays from U_3O_8 and working only with ionized air, the growth of the olive tree is not improved.

G. A. BRAVO

The tomato stalk and its value as a fodder. P. GUARNIERI. *Chim. ind. agr. biol.*

5, 243-4(1929).—Tomato stalks, after 3 months' storage, contain moisture 73.10, ash 5.68, sol. nitrogenous matter 3.50, fats 1.25, cellulose 11.31, easily digested proteins 2.10%. There is a little (0.008%) solanine in the leaves. No solanine was found in dried stalks.

G. A. BRAVO

The analysis of tomato plants. I. O. OWEN *J. Agr. Sci.* 19, 413-32(1929).—In expts. to det. the role of phosphates in tomato culture, tomato plants were analyzed for K_2O , P_2O_5 and N. In unfertilized plants the fruit is of inferior quality but the wt. as picked is $2.6 \times$ that of the foliage and stems. In fertilized plants this ratio is 1.6. Fertilized plants have a higher ash content than unfertilized. The removal of the 3 nutrients per plant where fertilized is 18.22 g. K_2O , 2.028 g. P_2O_5 and 9.324 g. N; for unfertilized plants the figures are K_2O 2.775, P_2O_5 0.9895 and N 4.922 g. Analyses of trimmings and leaves at different times of the year suggest that the actively growing parts are the richest in the 3 nutrients. The compn. of fresh fruit from fertilized plants is H_2O 93.5, K_2O 0.3237, P_2O_5 0.0491 and N 0.1591%; that for fruit from unfertilized plants is H_2O 94.9, K_2O 0.0556, P_2O_5 0.0355 and N 0.1769%. The distribution of the total nutrients between the fruit and vegetative parts is different for fertilized and unfertilized plants. Tomato plants yielding good crops show a relatively high ash content. Of all trusses on a plant the 3rd and 4th are richest in the 3 nutrients detd. The relative amt. of K_2O in the whole of the aerial parts of the plant tends to fall as the season progresses.

P. R. DAWSON

The formation of xanthophyll, carotin and chlorophyll in illuminated and unilluminated barley seedlings. H. VON EULER AND HARRY HELLSTRÖM. *Z. physiol. Chem.* 183, 177-83(1929).—Barley grains were germinated in the dark for 9 days, then exposed to the light for 5 days, detns. being made daily of the xanthophyll, chlorophyll and carotin content of the seedlings after the 6th day. The xanthophyll content increased regularly from the 6th to the 9th day, but thereafter showed a decrease if the seedlings remained in the dark and a further regular increase when they were brought to the light. During the period of exposure to light the increase in carotin closely paralleled the increase in chlorophyll. Both increased at a more rapid rate than the xanthophyll. In etiolated plants carotin was not found in measurable quantities. Not only chlorophyll formation, but apparently also carotin formation, is a photochem. reaction. These 2 pigments are believed to stand in close relationship to each other.

A. W. DOX

Electrical potential differences in the individual cell. LUDWIG JOST. *Sitzb. Heidelberg Akad. Wiss.* 1927, No. 13, 3-26; *Chem. Zentr.* 1928, I, 2262-3.—The potential differences in the internodal cells of *Chara coronata* and *Valonia* in various electrolytes such as KNO_3 - $LiNO_3$ or KCN - K_2SO_4 were detd.

C. R. FELLERS

Factors influencing the growth and sugar content of cane. K. KRISHNAMURTHI RAO. *J. India* 24, 91-101(1929).—A review with special reference to conditions in India.

K. D. JACOB

The effect of mineral water on higher plants. G. BILLARD AND A. MOUGROT. *Presse méd.* 37, 546-51(1929).—The action of different French mineral waters on the germination and first development of 3 classes of seeds has been studied. The favoring or retarding action varies with the pH of the water, its compn. and the group of seed, according to the nature of the reserve substance, whether fat, protein or starch. The action is exerted on the cells directly. The sprouting of leaves of *Vitis vinifera* was generally retarded. Two exceptions are attributed to the chem. compn. of the water. The root depends more on the pH with an optimum at 6.5. The optimum for the root of *Salix viminalis* is pH 7.6. The blossom also depends on the pH . The stem of the tulip regulates the pH to 6.5-6.7 and preserves the blossom.

A. E. MEYER

The effect of certain salts on the germination of seeds of *Amarantus retroflexus* L. B. N. AXENTYEV. *Biochem. Z.* 211, 454-67(1929).—The percent of germinating seeds in various salt solns and mixts. was detd.

S. MORGULIS

Studies on the processes in tobacco fermentation. THALES ANDREADIS. *Biochem. Z.* 211, 378-94(1929).—The cleavage of methoxyl is brought about by pectase found in tobacco leaves. This hydrolyzes pectin so rapidly that it is even amazing that any MeOH ester remains in the leaves. Through autolysis also MeOH is set free from pectin, to the extent of about 50% in 2 hrs., or even through the action of H_2O at high temp. whereby the H -ion concn plays an important part. Hexosediphosphatase, lipase, amylase and ketone aldehyde mutase were also demonstrated in the ripe tobacco leaf.

S. MORGULIS

Electrical effects accompanying the decomposition of organic compounds, considered in relation to photosynthesis and plant nutrition. M. C. POTTER. *Zentr. Bakt. Parasitenk.* II Abt., 78, 56-63(1929).—Since the breaking down of carbohydrates sets free electromotive force, part of the energy stored in the plant must be electrical.

Catalysis (as in respiration) and synthesis (as in photosynthesis) are always accompanied by an e. m. f., the signs being opposite in the two operations. The origin of all e. m. f. in living plants is the physico-physiol reactions taking part in the life processes of the various cells. The e. m. f. is an index of the plant. The gases liberated in catalysis and in physiol. and atmospheric combustion are org. and are ionized (activated). Elec. energy liberated by the ionized gases appears to be an essential factor in photosynthesis. Thus the amt. of ionized CO_2 , not of inactive CO_2 , is important. The decrease of atm. potential about trees in foliage is in accord with this. Catalytic enzymes which render energy kinetic must differ from synthetic enzymes which render energy potential. There must be endo-electric and exo-electric reactions analogous to endo- and exo-thermic reactions and a relation must exist between the two forms of energy. E. m. f. is liberated by all decompn. of org. matter in soil and water, and there is some evidence that the plant uses this energy in growth.

JOHN T. MYERS

The biology of yeasts in aerated culture media. FRIEDRICH WELEMSKY AND EGON BUTSCHOWITZ. *Zentr. Bakt. Parasitenk.*, II Abt., 78, 178-91(1929).—The marked increase in multiplication of yeasts when air is drawn through the culture is not due to increased O tension but to agitation, which decreases local concn. of metabolic products. The formation of alc. seems to be a normal yeast cell function which does not interfere with cell division.

JOHN T. MYERS

Studies on the yeasts of nectar. HEINRICH ZINKERNAGEL. *Zentr. Bakt. Parasitenk.*, II Abt., 78, 191-222(1929).—The only sugars in the nectar of most plants were dextrose and levulose. In one case saccharose was found. The yeasts found wild in nectar usually fermented only these 2 hexoses

JOHN T. MYERS

The influence of the electric current of low and high frequency on the growth of various microorganisms. HELMUT DRITZ. *Zentr. Bakt. Parasitenk.*, II Abt., 78, 386-403(1929).—A 220-v. current with a 50-period cycle, and Ag electrodes was definitely bactericidal, probably in consequence of the electrolytic formation of injurious substances in the medium. Ag ions play a part, since bactericidal action decreases when they are pptd. However, the Ag ions mitigate the effect of Cl. Yeast cells in large no. decrease the effect by adsorbing toxic radicals. The current from Ag electrodes was just as injurious as from Pt because Ag ions destroy amino compds. and thus interfere with the source of N for metabolism. A magnetic field induced by a high-frequency current (3 million) increased the rate of growth of organisms in both liquid and solid media. This is probably due to thermal and purely elec. effects in the yeast cell rather than to secondary chem. action. The same high-frequency current passed through a culture had little effect because there were few electrolytic changes.

J. T. M.

Some chemical and morphological phenomena attending infection of the wheat plant by *Ophiobolus graminis*. HURLEY FELLOWS. *J. Agr. Research* 37, 647-61(1928).—Microchem. studies made on the roots of wheat plants infected with the disease known as take-all showed that the disease caused a non-uniform reduction of cellulose which was replaced by lignin and a slight amt. of suberin. This is especially true of the thickened cell walls and the lignitubers. Other substances are not changed by the disease.

W. H. ROSS

The translocation of potassium in tomato plants and its relation to their carbohydrate and nitrogen distribution. GEORGE JANSSEN AND R. P. BARTHOLOMEW. *J. Agr. Research* 38, 447-65(1929).—A study was made of the tomato plant in relation to its carbohydrate, N and K_2O assimilation. The plants used were grown on a full K nutrient soln. until 6 in. high and then transplanted with the exception of the check plants to a sand culture contg. no K. Microchem. analyses made at various stages in the growth of the plants show an increase in the percentage of dry matter in all parts of the low-K plants. The total dry wts. of high-K plants increase rapidly after the bloom stage. An inverse relationship exists between the K and the N content of the plant when the K is insufficient for normal growth, the total and water-sol. N being much higher for the low-K plants. In K-starved plants the K seems to be transferred to and localized in the meristematic and growing portions of the plants. Leaf starvation of the tomato due to the lack of K is progressive, extending from the lower to the upper leaves. The dead leaves are relatively free from K indicating that K had been translocated and reutilized by the growing portions of the plant.

W. H. ROSS

Relation of leaf acidity to vigor of wheat grown at different temperatures. ANNIE M. HURD-KARRER. *J. Agr. Research* 39, 341-50(1929).—The concn. of H ions in leaf juice of Hard Federation, Harvest Queen and Turkey wheats grown at temps. of 12-18°, 20-25° and 25-30°, resp., was found to be lowest at the low temp. and highest at the high temp. The first-mentioned variety grew vigorously and yielded well at both the low and medium temps., but the other 2 varieties grew normally at the low temp. only.

The medium-temp. plants of all 3 varieties grew most rapidly at first and almost without exception had the lowest titratable acidity, sp. gr., and dry wt. percentages throughout their vegetative stages. The high-temp. plants generally had the highest titratable acidity, sp. gr. and dry-wt. percentages. The magnitudes of the titratable-acid values were closely correlated with those of the sp. gr. measurements at all 3 temps. The p_H value reflected the degree of adaptability of each variety to the different temps. Those plants which were best adapted, as shown by a vigorous growth and development, had p_H values near 6.0 throughout the expt. Plants which were so injured that they failed to develop beyond the shooting stage developed much higher H-ion concns., extreme injury being accompanied by values near 5.6, while the plants were still in the vegetative stage.

W. H. ROSS

The mean and variability as affected by continuous selection for composition in corn. FLOYD L. WINTER. *J. Agr. Research* 39, 451-76(1929).—Continuous selection for protein and oil content in corn over a period of 28 yrs. has produced 4 types which are distinctly different in their compn. When compared with the original nonselected material the high-protein and the high-oil strains show a proportional increase of 50.01 and 109.79%, and the low-protein and low-oil strains a proportional decrease of 23.26 and 67.87%, resp. The high-protein and high-oil strains show no indications of having reached a limit to further increases. The low-protein strain has changed but little during the last 20 yrs, and the low-oil strain is approaching a physiol. limit to further decreases.

W. H. ROSS

A study of the nature of the nitrogenous compounds in fungous tissue and their decomposition in the soil. A. FLOYD HECK. *Soil Science* 27, 1-47(1929).—The C content of all fungous tissue studied is rather const., fluctuating for the most part only between 40 and 44%. The N content of the fungi found growing in the fields and woods varies from 1.5 to over 7%, and the most of these forms contain more than 4% of N on a dry basis. In mycelium produced on synthetic liquid media, the N varied from less than 2% to more than 6% for the same species. Fungous N is for the most part very simple. From 40 to 70% of the N in the dry fungous tissue used in this work was H_2O -sol. and of this portion, 80 to 92% was dialyzable through a collodion sack. From 80 to 85% of the total N was sol. in 0.05 N NaOH in 60% alc. From 40 to 65% of the N in the H_2O sol. and alc.-sol. fraction was free amino N. No urea was found in the tissue tested. Most fungous tissues decomp. readily in moist soils. From 40 to 60% of their C is liberated as CO_2 in 26 days. On decompn. the N which they contain is liberated as NO_3 to the extent of from 30 to 42% of the original amt. during a period of 26 days. When there is no other energy material present, living fungous tissue liberates its own N by autolysis to even a greater extent than the dead tissue. The N in fungous tissue in the soil is as readily nitrified as, or even more rapidly nitrified than, that of other org. materials of similar N content.

E. F. SNYDER

Amylases of the cereal grains —oats. JULIAN L. BAKER AND HENRY F. E. HULTON. *J. Chem. Soc.* 1929, 1655-60.—Amylase pptd. from alc. from ungerminated oats acts differently from that of rye and barley. It liquefies starch paste slowly, the diastatic power being only 2°. It produces only cryst. maltose from potato starch at 50°, indicating that the starch mol. consist of condensed maltose residues. It has a solvent action on oat starch, producing glucose. The amylase from germinated oats liquefies starch paste readily, producing a dextrin, a malto-dextrin-like substance and a sugar having the const. of maltose.

Methods of detecting vitamins, particularly vitamins A and B. E. C. VAN LEERSUM. *Nederland. Tijdschr. Geneeskunde* 73, II, 3997-4009(1929).—A review dealing particularly with the biological methods of tracing vitamins; increase of weight is no reliable indication for vitamins; changes of bony structures are to be preferred for detn. R. B.

A widespread occurrence of xanthine calculi in sheep. T. H. EASTERFIELD, T. RIGG, H. O. ASKEW AND J. A. BRUCE. *J. Agr. Sci.* 19, 573-84(1929).—The occurrence of xanthine calculi in the kidneys of sheep on certain poor pastures in the Monterey Hills, Nelson District of New Zealand, appears to be assoc. with soils highly deficient in both Ca and P_2O_5 . The analysis of pasture samples shows a striking deficiency of both these constituents. Samples of green growth, obtained after a dry summer and fall, show a great deficiency of Fe and an abnormally high content of Mn. In spring

samples the content of these elements is normal. It is suggested that Fe deficiency is not the main factor contributing to the disease. Typical "Bush" sickness, definitely assocd. with Fe deficiency, is not known in this region. P. R. DAWSON

Some analytical remarks on the vitamin A. S. H. BERTRAM. *Proc. Acad. Sci. Amsterdam* 32, 664-8(1929).—B. discusses some of the literature in the light of his own results. The original should be consulted. J. A. KENNEDY

Nature of the rickets-producing factor in cereals. L. MIRVISH. *Nature* 124, 410-11(1929).—It has been suggested that the production of rickets by an excess of cereal may be due to an antivitamin. To det. this, oatmeal was boiled with 1% HCl and dialyzed. The dialyzate was evapd. to dryness and extd. with 95% alc., which was again evapd. When this residue, dissolved in water, was injected into rabbits, it lowered the blood Ca 30-35% in 24 hrs. with a return to normal in 48 hrs. This action is similar to that of an ext. of bovine ovaries made the same way. Rickets is primarily due to the lowering of blood Ca, which in turn may be caused by lack of Vitamin D, by excess of cereals, or by a faulty Ca-P ratio. AMY LEVESCONTE

Vitamin B. RUDOLPH A. PETERS. *Nature* 124, 411(1929).—At least 5 vitamin B factors have been described. They are: (1) the original thermolabile antineuritic factor, (2) a thermolabile factor described by V. Reader (*J. Soc. Chem. Ind.* 47, 1247 (1928)), (3) the thermostable antipellagra factor, (4) a thermostable factor described by Hunt (*C. A.* 23, 417) and (5) the factor described by Williams and Waterman (*C. A.* 22, 3907). AMY LEVESCONTE

Vitamins. ALFRED CLARK. *Trop. Agr. (Trinidad)* 6, 81-2, 110-11, 138-40, 166-9(1929).—A summary of the present state of knowledge regarding the nature of vitamins and the consequences of consuming diets lacking them. A. L. MEHRING

Animal nutrition. T. B. WOOD. *Trop. Agr. (Trinidad)* 6, 198-9(1929).—An equation was derived by which the maintenance requirements of animals and the starch equiv. of feeds may be calcd. as follows: $R = Kw^2/m + gc$, where R is the ration in starch equivalents, K is a const. (nearly 0.053 for all farm animals), w is the live wt. in lb., m is the basal metabolism per unit area per unit time, g is the live wt. increase in lb. per day and c is the wt. of starch equiv. required to make 1 lb. of live wt. increase. When 100 sheep were fed a ration calcd. to produce a live wt. increase of 2.25 lb. per week according to the equation, an actual increase of 2.22 lb. was obtained. A. L. MEHRING

Irradiated ergosterol in rickets. A. B. MARFAN. *Presse méd.* 37, 749-52(1929). A. E. MEYER

Vitamin D and craniotabes; the necessity for a biological control of commercial vitamin preparations. J. P. GARRAHAN AND J. C. TRAVERSARO. *Semana méd* (Buenos Aires) 36, 824-7(1929).—Sixteen cases of craniotabes were treated with commercial vitamin D preps.; 4 became worse, 9 were unchanged and 3 improved. A. E. MEYER

The vitamin B content of different yeasts and of wheat bread prepared therewith. ARTHUR SCHUBNERT AND MARTIN SCHIEBLICH. *Biochem. Z.* 212, 80 6(1929); cf. *C. A.* 23, 1165.—Bakers' yeast contains only $1/2$ to $1/3$ of the antineuritic factor of vitamin B as brewers' yeast, but in regard to the antipellagra and growth-promoting factor there is no difference between them. With baked bread contg. the usual amt. of yeast it is impossible to give pigeons the necessary protection because they cannot consume enough of the food, but such is the case with bread contg. 3 times the ordinary quantity of yeast. In rat expts. it was possible to demonstrate that bread prepd. with baking powder is inferior to that made with yeast. S. MORGULIS

The Metchnikoff theory and the influence of diet on the intestinal flora, growth, abortion, fecundity and blood picture in the white rat. V. Growth, abortion and fecundity on a variety of diets and the accompanying intestinal flora. MARTIN SCHIEBLICH. *Zentr. Bakt. Parasitenk.*, I Abt., 113, 41-55(1929). VI. The blood picture in a variety of diets, and the accompanying intestinal flora. *Ibid* 55-63; cf. *C. A.* 23, 4727. JOHN T. MYERS

Role of vitamin C in the nutrition of calves. L. M. THURSTON, L. S. PALMER AND C. H. ECKLES. *J. Dairy Sci.* 12, 394-404(1929).—Vitamin C was found in the livers of calves fed for one year on food which produced scurvy in guinea pigs in 30 days. Heifers, fed from birth on a diet deficient in vitamin C, gave normal reproduction and secreted vitamin C in the milk. Vitamin C is probably synthesized in the bovine body, though tests indicate the absence of vitamin C in the stomach and feces of the calf. N. M. NAYLOR

Vitamins. A short review of later investigations. CARL H. HANSEN. *Dansk. Tids. Farm.* 3, 125-30(1929).—The properties of vitamins A, B and C are briefly discussed. Of these the fat-sol. vitamin A is considered at some length. This vitamin was

formerly found to be antixerophthalmic, antirachitic and capable of accelerating growth. Lately it has been shown that it may be divided, and a vitamin D which is antirachitic obtained. The vitamins A and D were found only in animal fats, but lately by exposure to light with a wave length of about 300μ inert plant oils, *e. g.*, olive oil and linseed oil, could be made antirachitic. The possible sources of vitamins are also considered.

O. A. NELSON

The nutritive requirements of milch cows in relation to the composition of the milk produced. NILS HANSSON. *Proc. 8th World's Dairy Congress 1928*, 190-7.—Tests carried out over a period of 2 decades have shown that: (1) The quantity of productive food required by milch cows, both with regard to the general food value of the food and to its albumin content, is to a high degree dependent on the compn. of the milk produced. (2) The albuminous substances contained in the food may be limited to the quantities which fulfil the special function of these food substances, since the fat and sugar in the milk are mainly formed from non-nitrogenous food substances, particularly carbohydrates. (3) Milch cows can transfer into the milk a much larger proportion of the digestible energy in the food than fattening cattle; on an av. one can calc. that the latter can only absorb about 80% (78-82) of the net energy which the milk produced contains. (4) The nutritive requirements of milch cows is directly dependent on the energy content and the albumin content of the milk produced. (5) The production food required by milch cows may be estd. as 0.30 food unit (defined as the amt. of net energy, which, with an all-round diet, is recovered in the amt. of milk produced by 1 kg. of barley or by the quantities of other foodstuffs equiv. thereto) per kg. of milk when the fat content of the latter amounts to 2.75% and to 0.42 food unit when the fat content is 5.0%. (6) Under normal conditions a max. of 75% of the digestible albumin contained in the food is to be found in the milk; this figure, however, is dependent on the biol. value of the albumin in the food, and it is, therefore, advisable to continue to reckon with at least 45-50 g. of digestive albumin per kg. of milk. (7) Feeding quantities of albumin amounting to not more than 10-20% above the min. thus calcd. to some extent stimulates the yield of milk, but a further increase in the amt. of albumin does not seem to have any further effect. A bibliography of 15 references is given.

A. PAPINEAU-COUTURE

Activated milk. HOFFMAN. *Proc. 8th World's Dairy Congress 1928*, 460-2.—The 2 main difficulties in activating milk by treatment with ultra-violet rays are that the rays must act upon a very thin layer of milk and that change of flavor (jecorization) must be avoided. H. has devised an app. for overcoming these, the milk flowing through an adjustable slotted distributor over a narrow-mesh corrugated wire cylindrical net in the center of which is the irradiating app. To avoid jecorization the source of light is a sort of quartz Geissler tube with condenser electrodes filled with Hg-A which emits cold rays instead of the usual quartz lamps which emit intense heat rays. An air lock or the use of a protective gas is unnecessary. Destruction of vitamins A and C by O_3 which may be formed when air is permitted to enter the app. is of no consequence in the case of pasteurized milk, as these vitamins are already destroyed by pasteurization; with raw milk, a protective gas (preferably N) can be used. Rats fed on rickets-producing food with an addn. of 8 cc. of ray-treated milk showed after 3 weeks of such feeding no signs of rickets, as compared with the control animals. Animals suffering from rickets became quite healthy after being fed 4 weeks with ray-treated milk (6 cc. per day), while the animals fed on untreated milk either died or did not recover.

A. P.-C.

Antineuritic and water-soluble B vitamins in beef and pork. RALPH HOAGLAND. *J. Agr. Research* 38, 431-46 (1929).—Lean pork is an excellent source of the antineuritic vitamin, comparing favorably in this respect with brewers' yeast. Beef contains much less of the antineuritic vitamin than pork. Lean pork is also a good source of water-sol. B vitamin but it does not contain so much of these vitamins as either brewers' or bakers' yeast. No material difference was observed between fresh and smoked hams as sources of either the antineuritic or water-sol. B vitamins. Lean beef contains much less water-sol. B vitamins than lean pork.

Influence of desiccated thyroid and iodine on growth. II. With a standard acid diet. F. E. CHIDESTER AND W. M. INSKO, JR. *Am. Naturalist* 43, 239-47 (1929).—Exptl. data are given.

G. SCHWOCH

Minimum protein requirements of cattle. H. H. MITCHELL. *Bull. Natl. Research Council* No. 67, 84 pp. (1929).—A bibliography and a review of the literature are given. Sherman's value of 0.6 g. of N per kg. of body wt. as the minimum protein requirement for maintenance of N equil. and the values of others, ranging from 0.4 to 0.7 g., seem to be too high, even if allowance is made for a large margin of safety. Low values of 0.2 g. of N have been published along with evidence that shows that the animal adjusts itself to a low N intake. A value of 0.3 g. per kg., or 0.19 lb. of protein per 1000 lb. of body

wt., is a safe min. for pigs, sheep, cattle and men. The protein requirement for growth is measured by the rate of deposition of protein in the tissues of growing animals and must be differentiated from the protein requirement of fattening. The only reliable evidence from which the N requirement of growing cattle can be estd is that of the Mass. Agr. Expt. Sta. N retention is from $1/3$ to $1/2$ that predicted from the Armsby equation. It seems improbable that there is any such generalized relation between gain in protein and age of the animal, as assumed by Armsby. The equiv. age of Brody rather than the absolute age of A. may prove more useful in calcg. rate of growth. The protein requirements for fattening, pregnancy and milk production are discussed. The problems of nutrient requirement of animals will be solved satisfactorily only when it is factored into its ultimate and independent terms of size, stage of gestation or rate of milk production.

H. GREGG SMITH

Hyperavitaminosis. I. Studies on the metabolism of the hyperavitaminized rabbit. H. SUGATA. *Sei-i Kwai Med. J.* 48, No. 4, 1-44 (1929), Abstract Sect. No. 4, 1-9.—When an excess of vitamin A is injected into the rabbit, there is a gradual increase in blood non-protein N, uric acid, creatinine and creatine and a decrease in urea. Blood sugar shows a temporary rise followed by a drop in amount. Glycogen of the liver and muscles decreases. Plasma lecithin and fatty acids increase more than does cholesterol, while in controls, injected with cholesterol and olive oil or with cod-liver oil, cholesterol instead of lecithin tends to increase. The animals show almost the same symptoms as when emaciated after vigorous exercise and they die in a short time. With moderate doses of the vitamin there is a subcutaneous accumulation of fat and a decrease in urinary excretion, the two factors together causing an increase in body wt. There is a negative nitrogen balance and a decrease in urea and increase in ammonia excretion. These results furnish evidence that death caused by excess vitamin A is the result of destruction of cell activity, due to overfunction.

H. GREGG SMITH

The metabolism of the hypervitaminized rabbit. H. SUGATA. *Sei-i Kwai Med. J.* 48, No. 6, 1-37, Abstract Sect. No. 6, 1, cf preceding abstract. The death of hypervitaminized rabbits is due to the destruction of cell activity.

E. J. C.

Irradiation of sterols; relations between irradiated sterols and antirachitic vitamin. R. FABRE AND H. SIMONNET. *J. pharm. chim.* [8], 8, 489-506 (1928), cf *C. A.* 22, 3438; 23, 421, 2741.—The studies on irradiation of cholesterol and ergosterol since 1925 are reviewed. The spectroscopic method for the examn of sterols before and after irradiation is discussed in detail, and ultra-violet absorption curves of ergosterol in alc. soln. (1:10,000) before and after irradiation for 10, 20 and 30 min. are shown. Irradiations alter the mol. of ergosterol, producing a trace of a compd. photochemically unstable but having very pronounced antirachitic properties. A list of 36 references is given.

S. WALDBOTT

Activity of irradiated ergosterol. RENÉ FABRE AND H. SIMONNET. *J. pharm. chim.* [8], 9, 331-8 (1929); cf *C. A.* 22, 3438 and preceding abstr. Very active products were obtained whether ergosterol (A) was irradiated (a) dry for 30 min. or 6 hrs., or in Et_2O soln. for 20-30 min., cold, in an inert atm., or (b) for 6 hrs., with no precautions, in alc. soln., but no simple relation appeared between the antirachitic property and the no. and position of maxima of the ultra-violet absorption curve, or the behavior toward digitonin (B). In a the character of the curves remained unchanged and the ppt. with B was but slightly lessened; in b the product, a yellowish resin, gave but feeble pptn. with B, and the character of the curve was thoroughly changed (diagrams are given). By fractional pptn. of irradiated a in Et_2O soln. with weak alc., 2 cryst. ppts. were obtained devoid of activity but they gave nearly the same curves as the original; the residual amorphous A had the full antirachitic property, and the curve was identical with that in b. Hence the significance of phys. and chem. tests can be established only by comparison with biol. examn.

S. WALDBOTT

Sodium and potassium balances when used as citrates in acidotic and rachitic conditions in rats. JOHN H. SPEER, VERA V. COLE AND FREDERICK W. HEYL. *J. Am. Pharm. Assoc.* 18, 225-8 (1929); cf *C. A.* 23, 4592.—Rats were kept on diets sufficiently deficient to produce acidosis. One lot of rats was fed Na citrate and the other half a mixt. of Na and K citrates, the total alky. being the same for each lot. Ca lactate was added to each. Na and Ca do not conserve K; Na and Ca favor Ca retention. Na, K and Ca favor K retention and also Ca although too much K with low Na is less favorable to retention of Ca. No difference was found on P retention whether Ca, K and Na were added or only Ca and Na. Most favorable results were obtained with all three elements Ca, Na and K added. The proportions of Na to K should be about as 5.9:1.

E. K. MARSHALL, JR.

Oxygen absorption curve of fatigued muscle as a function of hydrogen-ion concentration. M. COMELI. *Atti accad. Lincei* [6], **8**, 255-7(1928); cf. *C. A.* **22**, 3894.—The curve of O absorption by fatigued frog's muscle in solns. of varying p_{H} values shows 2 points of inflection and a max. By writing $y = f(p_{\text{H}})$, where y is the rate of absorption of O, it is found that $y = 0$ when $p_{\text{H}} = 5.3$. The complete curve may be represented by $y = ax + bx^2 + cx^3 + dx^4$, where $x = (p_{\text{H}} - 5.3)$. The coeffs a and c are pos., and b and d are neg. On analysis, the curve may be regarded as consisting of 3 portions divided by the points of inflection which occur at p_{H} 7.0 and 6.6, resp. The first portion, for p_{H} values near neutrality, corresponds with a high rate of O absorption. Between p_{H} 6.6 and 6.0 recovery of the muscle is moderately rapid and may be taken to represent physiol. conditions. At p_{H} values below 6.0 the absorption rate falls rapidly, becoming zero at p_{H} 5.3. B. C. A.

Recent investigations on the humoral regulation of the heart. DEMOOR. *Bull. acad. roy. med. Belg.* [5], **8**, 882-902(1928).—A review and discussion of the work of Zwaardemaker (*Ergeb. A chemical study of urine as affected by combinations of ammonium chloride and methenamine. EDWIN C. WISE AND FREDERICK C. WISE. *Arch. Internal Med.* **44**, 252-62(1929). Ingestion of 15 grains NH_4Cl in human adults on a diet producing nearly neutral urine rapidly lowers the p_{H} of urine to 5.5. The effect of combining this salt with methenamine on the concn. of CH_2O in the urine is described. J. B. BROWN

Thyroid and growth. FREDERICK S. HAMMETT. *Quart. J. Biol.* **4**, 353-372 (1929).—Mostly a review. J. B. BROWN

The differentiation of the reducing bodies in the urine during pregnancy. REED ROCKWOOD AND EVA F. DODGE. *Surgery Gynecol. and Obstet.* **47**, 660-4(1928).—Twenty eight % of a series of urines from pregnant women showed reduction by the Benedict test. In 5 cases osazones of unknown type were isolated. It was possible to isolate lactosazones in only half of the non-fermentable specimens. Before breast engorgement the reducing body is usually glucose while during that stage it is usually lactose. J. B. BROWN

A study of the metabolism of two breeds of pig. (With some remarks on a third.) THOMAS DEIGHTON. *J. Agr. Sci.* **19**, 140-81(1929). Calorimetric studies were made of the metabolism of a Berkshire and a Middle White pig. Conclusion: The existence of a max. somewhere in the curve showing fasting catabolism per unit area at different ages is necessitated by the 2 phys. facts: (a) that warm-blooded animals have to be maintained at a temp. which varies only within very narrow limits and (b) that the processes of growth are accompanied by waste of energy as heat. The fasting catabolism per unit area in pigs is shown to be greater than that in several other animals, including man. A bibliography of 38 references is appended. P. R. DAWSON

Furthering of bone growth by injection of bone extract. CARLA ZAWISCH-OSSENITZ. *Wiener klin. Wochschr.* **42**, 733-7(1929).—An enzyme prepn. from areas of rapid bone development in young animals injected subcutaneously favors bone growth. D. B. DILL

The question of choline in the placenta and its relation to labor pains. FRITZ WREDE, ERICH STRACK AND ELSE BORNHOFFER. *Z. physiol. Chem.* **183**, 123-32(1929).—According to Sievers (*C. A.* **22**, 3919) the human placenta contains many times as much choline as do other organs; hence there is in the placenta a mobilization of choline which brings about the contractions by which the fetus is expelled. Sievers reported a choline content corresponding to 90 mg. per kg. of fresh placenta. He compared this with the choline content in mg. per organ of beef suprarenals and ovaries reported by other investigators. Such a comparison is obviously absurd. Detns. now reported by the

authors run considerably higher, viz., 185 mg. per kg. of fresh placenta. A comparison of the choline content of cow placenta (114 mg. per kg.) with that of other organs, *e. g.*, spleen, pancreas, lung, muscle, kidney and intestine (150-300 mg. per kg.) disposes of the mobilization theory. Moreover, placentas obtained by Caesarian section in cases where the contractile power was insufficient to expel the fetus showed the same choline content as placentas from normal births. Sievers' view that the pressure on the placenta at the time of birth forces choline into the uterus and thus promotes the uterine contractions is untenable in the light of these observations. A. W. DOX

The influence of muscle training on the content of phosphorus compounds. D. FERDMANN AND O. FEINSCHMIDT. *Z. physiol. Chem.* 183, 261-8(1929).—The "training" consisted in stimulation of one biceps femoris of a rabbit 3-4 min. at 4-hr intervals by means of an induction current, the other biceps serving as a control. After 9-22 days of this treatment the animals were killed and the muscles analyzed. The training resulted in a high increase in the creatinephosphoric acid content of the muscle. Unlike the increase in glycogen content obtained in this way by other investigators, the increase in creatinephosphoric acid is not permanent and disappears within 4-6 days after the training is discontinued. No change was observed in the pyrophosphoric acid content of the muscle. The hexosephosphoric acid content showed no increase, but on the contrary a slight decrease. This substance evidently is not a source of energy for muscular contraction, and represents merely an intermediary product of carbohydrate metabolism. A. W. DOX

Secretion of digestive enzymes in relation to blood chemistry. I. Alkali reserve and chlorides in blood. S. I. PRIKLADOVITZKII AND M. P. BRESTKIN. *Z. ges. expl. Med.* 64, 494-505(1929).—See *C. A.* 23, 4246. F. L. DUNN

The chemistry of hormones. O. MÜHLBOCK. *Metallbörse* 19, 1575-6, 1685-6(1929).—A general account of hormones, including adrenaline, insulin, thyroxine, etc. W. C. EBAUGH

Reciprocal relations between ovarian function and the mineral content of the blood. A. SCHEPETINSKY AND M. KAFITIN. *Arch. Gynakol.* 136, 397-406(1929).—A study was made of the mineral content of the blood in 60 healthy women aged from 19 to 30, the detns. being made on the same individual in various phases of menstruation. The Ca content varied within normal limits during menstruation and increased slightly toward the upper limit of normal in the premenstrual period. The K content tended to decrease during menstruation while the Na content decreased markedly and the chloride content was relatively low. The content of inorg. P remained within normal limits in the premenstrual period and during menstruation. In primary and secondary amenorrhea (hypofunction of the ovary) the Ca content remained in the upper limits of normal; the P, Na and chloride contents were normal and the K content was considerably decreased. In the climacteric the K, inorg. P and Na contents remained normal; the Ca content varied with the individual, sometimes increasing and sometimes remaining within the normal limits; while the chloride content decreased. HARRIET F. HOLMES

A comparative study of the digestion of proteins and carbohydrates in goats during infusoria-free and infected periods. ELERY R. BECKER, J. A. SCHULZ AND M. A. EMMERSON. *Proc. Nat. Acad. Sci.* 15, 691-3(1929).—Digestion tests were made on 4 goats rendered free of rumen infusoria for 2 or 3 weeks and then reinfected with *Entodinium* and *Diplodinium*. In both cases the same wt. of hay and grain mixture was fed. Detns. were made of the digestibility coeffs. of the protein, ether ext., N-free ext., crude fiber, hemicellulose, pentosans, α -cellulose and total dry matter, the partition of N between feces and urine, and the N stored daily. None of these showed any significant advantage to the host from the possession of infusoria. AMY LE VESCONTE

Some chemical investigations of embryonic metabolism. IV. An investigation of the basic amino acids of the hen egg during development. H. O. CALVERY. *J. Biol. Chem.* 83, 649-56(1929); cf. *C. A.* 23, 4725.—The basic amino acid content of the developing hen egg has been detd. throughout the entire period of development. The arginine remains practically const. during the entire period. The values for histidine and lysine were both inconsistent but it is believed that both of these amino acids decrease in amt. The results are entirely in agreement with the theory that arginine does not serve as a precursor of purines while histidine may do so. A. P. L.

Composition of bone. VII. Equilibrium of serum solutions with dicalcium phosphate. M. J. SHEAR, MARTHA WASHBURN AND BENJAMIN KRAMER. *J. Biol. Chem.* 83, 697-720(1929).—See *C. A.* 23, 2451. **VIII. Conductivity titrations of calcium ion with chloride, acetate, lactate and citrate ions at 38°.** M. J. SHEAR, BENJAMIN KRAMER AND LOUIS RESNIKOFF. *Ibid.* 721-35.—NaCl, AcONa and Na lactate give normal cond.

titration curves with CaCl_2 at 38° . Na citrate gives abnormal curves but the same type of curve is obtained regardless of whether the Ca soln. is acid, neutral or alk. in reaction. These results are further evidence for the binding of Ca ions by citrate ions in some kind of sol. slightly ionized complex.

A. P. LOTHROP

The occurrence of a new highly unsaturated fatty acid in the lipides of the brain. J. B. BROWN. *J. Biol. Chem.* 83, 783-90(1929).—A highly unsatd. acid of higher mol. wt. and more unsatd. than arachidonic acid has been isolated from the brain. It has a b. p. above 250° and it is suggested that the acid may be a penta-unsatd. lignoceric acid, the name of which would be tetracosapentenoic acid. Arachidonic acid is also present and besides these 2 there may be in addn. other unsatd. acids from the C_{20} to the C_{24} series. Different preps. from the brain give a content of 11.5 to 18.4% of highly unsatd. acids, which is much higher than that for any other tissue studied. Only 24% of the total wt. of the lipides can be recovered as the Me esters and about 10% is cholesterol. A considerable amt. of high-boiling material cannot be distd. even in a high vacuum.

A. P. LOTHROP

The thermal zone of neutrality in the basal metabolism of the albino rat. BRANIMIRO MALES AND JAIME MAGAZ. *Boll. soc. ital. biol. sper.* 4, 461-5(1929). P. M.

A sulfuric acid ester of protein in the anterior lobe of the hypophysis. SIGMUND FRÄNKEL AND GABRIELE MONASTERIO. *Biochem. Z.* 211, 259-63(1929).—The anterior lobe ground aseptically in physiol. saline loses both its ovarian and its growth effect on heating or on addn. of too much alc. If, however, the saline ext. is treated with enough alc. not to exceed a concn. of 50%, the fluid portion sepd. from the pptd. proteins shows an effect on the ovary but does not produce the growth stimulation. The substance attached to the pptd. protein fraction appears thus to be extremely labile. Expts. were therefore instituted with fresh organs ground aseptically to a sludge. This was always acid and was neutralized by adding 5 g. NaHCO_3 per 300 g. tissue. The mass was centrifuged and washed several times with water. The aq. ext. was electrodialed against H_2O , and CO_2 passed through the undialyzed fraction in the cold ($+1^\circ$). A white ppt. settles out which is removed by centrifuging and washed with water satd. with CO_2 . This is dissolved in a very small quantity of NH_4OH and again pptd. with CO_2 , and this is repeated several times. Upon drying over H_2SO_4 *in vacuo* this substance undergoes a striking change in that it becomes very much less sol. in NH_4OH . The yield of this substance is about 1% of the fresh or 2.5% of the dry organ. The substance is very acid and behaves very much like a globulin by being pptd. by CO_2 from a salt-free soln. The substance gives the biuret but not all the other protein reactions; the Molisch and the Hopkins-Cole tests are neg. as well as the Pb acetate reactions for S. The substance, however, contains much S and P. Of the 9 atoms of S in the mol. 7 are in the form of H_2SO_4 . By leaving the P out of the calcn. the N:S relation is 7:1. The fresh substance dissolved in NH_4OH greatly hastens the coagulation of blood.

S. MORGULIS

Studies on blood coagulation. XX. Inhibition of coagulation by heparin. BERNHARD STUBER AND KONRAD LANG. *Biochem. Z.* 212, 16-21(1929); cf. *C. A.* 22, 2778.—Inhibition of blood coagulation through heparin both *in vivo* and *in vitro* is detd. by the inhibition of the blood glycolysis. XXI. Blood clotting and the fluorine content of blood. BERNHARD STUBER AND KONRAD LANG. *Ibid* 96-106.—The coagulation of blood in Kiel is much slower than in Freiburg. This delayed coagulation is attributed to the fact that in Kiel the blood contains F regularly. The Kiel water supply shows 1.65 mg. F per 10 l. while the Freiburg city water has only 0.28 mg. F per 10 l. In a case of *hemophilia* a high F content was demonstrated in the blood.

S. MORGULIS

Changes in ionic composition of organs under the influence of radiation and of high altitude. A. LOEWY AND L. PINCUSSEN. *Biochem. Z.* 212, 22-34(1929).—Radiation and, even to a greater degree, low barometric pressure, alter the quant. relationships between the K, Ca and Mg in vitally important organs. The alteration is almost invariably due to an absolute increase in the Ca and diminution in the K concn.

S. MORGULIS

Studies on the metabolism of the heart muscle. I. Heart glycogen. MARCEL HAENDEL AND A. MUNILLA. *Biochem. Z.* 212, 35-46(1929).—The glycogen contents of the heart, skeletal muscle, liver and the blood sugar were studied following the intra-peritoneal injection of 2 g. glucose per kg. In control animals the heart contained 0.567%, skeletal muscle 0.248% and the liver 1.2619% glycogen. Digitalin caused a marked fall in the heart glycogen content, but not in muscles or liver. Large doses of ouabain caused a general mobilization of glycogen, while small doses did not affect the muscle glycogen. In either case, however, hyperglucemia was produced. Similarly camphor produced hyperglucemia but the glycogen was generally diminished

only after large doses. Small doses did not alter the heart glycogen content. Caffeine had an effect similar to that of the camphor except that the muscle glycogen was more reduced. KCl causes hypoglycemia though it causes diminution in muscle and liver glycogen. CaCl_2 produces hyperglycemia and a marked drop in heart glycogen. A general diminution in glycogen content follows only large doses. Adrenaline causes a generalized mobilization of glycogen. In normal animals the heart glycogen content was unaffected by insulin contrary to its behavior in the pancreatized animal. Thyroxine had little influence on the heart muscle, but did reduce the muscle and liver glycogen. S MORGULIS

Chemistry of the sex glands. I. The discovery of a substance of the composition $(\text{CH}_3)_2\text{N}_6\text{C}_6\text{H}_{18}\text{O}_5$ in the testes. SIGMUND FRANKEL AND GABRIELE MONASTERIO. *Biochem. Z.* **212**, 61-5(1929).—This substance was obtained in pure crystal form from specially prepd. exts. of testes. Its constitution is yet to be studied. Its m. p. is 279° it contains no amino N, no carboxyl or methoxyl groups, $[\alpha]_D^{25} = +173.9$ S MORGULIS

The excretion of acid in urine during work. III. The excretion of phosphate during work of different intensities. MICHAEL S. RESNICHENKO AND NATALIE P. KOSMIN. *Biochem. Z.* **212**, 87-95(1929).—A definite increase in the P excretion was found only in short, strenuous expts. 0.5 to 0.7 km. running. S MORGULIS

Ammonia formation from amino acids in surviving organs. A. BORNSTEIN AND H. F. ROESE. *Biochem. Z.* **212**, 127-36(1929).—Surviving organs from fasting dogs (liver, lung, extremities) when perfused with blood obtained likewise from fasting dogs cause no alteration in the NH₃ content of the blood or cause a slight diminution. If glycine is added to the perfusion blood the NH₃ content of the blood of the extremity is not changed but that of the liver is increased several times. In the case of the lung there is also an increase in the NH₃, but to a much smaller degree than in the liver. Alanine and asparagine are likewise well deaminized by the liver, but none not so well. The liver deaminizes the offered amino acids very rapidly and very extensively when a large amt. of amino acid is contained in the perfusion blood. S MORGULIS

The decomposition of protein and amino acids of the food measured by the ammonia content of the blood. A. BORNSTEIN. *Biochem. Z.* **212**, 137-48(1929).—Upon intravenous injection of amino acids (glycine, alanine, asparagine) the NH₃ content of dog blood rises considerably within a few min. The urea content of the blood rises somewhat later. When given by stomach the amino acids produce a much less pronounced rise in the blood NH₃ and urea content, and it appears after a delay of an hr. Following a meal of meat similar changes in blood NH₃ and urea content are observed after a period of 4-5 hrs. S MORGULIS

Studies on the action of the hormone of the anterior lobe of the hypophysis. MAX REISS AND KÄTE LANGENDORF. *Endokrinologie* **3**, 161-74(1929).—The sex hormone of the anterior lobe of the hypophysis has the same effect on the genital septum of female dogs and rabbits as has already been noted in mice and in rats. The corpora lutea formed under its influence are genuine lutea bodies. The blood cholesterol is increased in normal female dogs and rabbits, this increase being associated with the ripening of the follicles. In ovariectomized animals this increase in blood cholesterol fails to appear as it also happens when there are no follicles in the ovary. However, a definite effect of pituitrin on the blood cholesterol could not be demonstrated. S MORGULIS

The effect of the anterior lobe hormone on the gaseous metabolism of rabbits. MAX REISS AND K. ANTON WINNER. *Endokrinologie* **3**, 174-9(1929).—No definite effect of the anterior lobe hormone can be established on the gaseous metabolism of rabbits. The respiratory quotient varies only within extremely small limits. S MORGULIS

Experimental studies on the ovarian hormone. ARTHUR V. PROBSTNER. *Endokrinologie* **3**, 338-43(1929).—Periodicity of the hormone formation depends on the presence of a maturing ovum. S MORGULIS

The place of the ovarian hormone in the hormone series. KARL CSEPAL, ADALBERT FORNET AND STEFAN PELLÁTHY. *Endokrinologie* **3**, 361-8(1929).—Menformone resembles insulin in its effect of lowering blood pressure. Quite generally it also influences the vegetative tone of both males and females in the direction of a sympathicohypotony. From the point of view of its action on the blood sugar menformone also is closer to insulin than to adrenaline. Menformone lowers the blood serum Ca but has no effect on the blood reaction. S MORGULIS

Anterior lobe hypophysis implantation in Rhesus monkeys. K. EHRHARDT, H. WIESBADER AND L. FOCSANEAU. *Endokrinologie* **3**, 401-5(1929).—In Rhesus monkeys

menstruation occurs without ovulation and the implantation of the anterior lobe of the hypophysis causes enlargement of the uterus without affecting corpus luteum formation. It is thus possible to sep. in this organism the hormonal action of the ovary from the follicular activity.

S. MORGULIS

Effect of parathyroid extract on the blood picture. ISTVÁN PRILLÁTHY AND JOSEPH V. FERNBACH. *Endokrinologie* 3, 406-12(1929).—Parahormone, like adrenaline or thyroïdin, produces leucocytosis with a great increase in myeloid cells.

S. M.

The effect of anterior lobe of hypophysis on ovaries injured by irradiation. ALFRED WALTER. *Endokrinologie* 4, 1-9(1929).—The ovary of the irradiated infantile mouse reacts to anterior lobe implantation so long as there are still uninjured eggs by formation of corpora lutea, but later when it is made up of only lutein tissue it reacts no longer.

S. MORGULIS

Does insulin affect the thyroid gland? C. F. RÄIHÄ. *Skand. Arch. Physiol.* 58, 8-10(1929). Structural changes in the thyroid gland have been noted in rabbits which have been used over a long time for testing insulin preps.

S. MORGULIS

The influence of diet on the action and metabolism of iron. WALTER ARNOLDI. *Folia Hematol.* 38, 339-54(1929).

JOHN T. MYERS

The individuality of the mammary glands of the cow. JOSEF PROKS. *Proc. 8th World's Dairy Congress 1928*, 296-9; cf. *C. A.* 23, 892. Analyses were made of the milk from each teat of 4 cows, and the max. differences in the consts. of the milk of the individual teats of each cow were as follows: H₂O 0.50-1.40%, fat 0.35-1.35%, albuminoids 0.04-0.35%, lactose 0.07-0.74%, ash 0.01-0.07%, solids not fat 0.13-0.71%, Reichert Meissl no. 0.8-1.8, Wauters Polenske no. 0.6-2.9, sapon. no. 0.6-5.8, I no. (Hubl) 0.49-1.61, refraction at 40° 0.7-1.0. These results show that the mammary glands of the same udder show individuality both from the anatomical point of view and from the point of view of the physiology of the milk formation as regards both the component elements of the milk and the compn. of the fat.

A. PAPINEAU-COUTURE

The cataphoretic velocity of mammalian red blood cells. HAROLD A. ABRAMSON. *J. Gen. Physiol.* 12, 711-25(1929); cf. *C. A.* 23, 2991. The following order of cataphoretic velocity of red blood cells in *M* 15 phosphate buffer at pH 7.35, expressed in μ per sec. per v. per cm., was found: Dog > rat > cat > mouse > monkey = man > guinea pig > opossum > pig > sloth > rabbit. The order was the same in isotonic glucose soln. The velocity is not affected by time of standing (up to 24 hrs.) or by successive washing of the blood cells. Although cholesterol and quartz adsorb gelatin from dil. soln. in phosphate buffer, red blood cells retained their original velocity even after 24 hrs. contact with gelatin soln. Pregnant and nonpregnant white female humans have the same red cell cataphoretic velocity. Severe anemia does not significantly change cataphoretic velocity of the red cells.

C. H. RICHARDSON

Phosphagen in the heart. G. MARTINO AND G. ZANGHÌ. *Boll. soc. ital. biol. sper.* 4, 551-2(1929). Detns. made upon the ox heart show that in the ventricular muscle phosphagen is present in amts. of between 6.5 and 7 mg. %, while in the muscles of the auricle the percentage varies between 4 and 6 mg. %.

G. H. SMITH

Phosphagen in the uterus. V. SIRACUSA. *Boll. soc. ital. biol. sper.* 4, 553-5(1929); cf. *C. A.* 23, 1915. In the dog uterus phosphagen was not found and the phosphoric acid varied between 17 and 34 mg. %, P. Limited work with the human uterus indicated that there may possibly be small quantities of phosphagen in the active uterus, there is none in the resting organ.

G. H. SMITH

Hormone of the hypophysis lipoid. RENZO AGNOLI. *Boll. soc. ital. biol. sper.* 4, 574-8(1929); cf. *C. A.* 23, 875. The ether sol. fraction of an alc. ext. of the hypophysis stimulates deamination.

G. H. SMITH

The relationship between serum calcium and age. ESTHER M. GREISHEIMER, OLGA H. JOHNSON AND MARY RYAN. *Am. J. Med. Sci.* 177, 704-9(1929).—Av. Ca content of the serum was 10.858 \pm 0.049 mg. in 141 women and 10.746 \pm 0.045 mg. in 177 men. It decreases with age, in women averaging 11.8 at 12 yr. and 9.7 at 78 yr., in men averaging 11.6 at 12 yr. and 10.0 at 78 yr.

R. C. WILLSON

Creatine-creatinine metabolism. J. L. BOLLMAN. *Proc. of the Staff Meetings of the Mayo Clinic* 4, 220-1(1929).—On a creatine-free, low-protein diet, the daily excretion of creatinine was not changed by oral or intravenous administration of creatine in amts. comparable to the daily excretion of creatinine. Unchanged creatine was recovered from the urine. Addn. of 10 g. casein to the diet did not produce any change, but 100 g. casein markedly increased the creatinine excretion and reduced the amt. of creatine recovered from the urine. Work was clinical and exptl. with dogs.

R. C. WILLSON

G—PATHOLOGY

H. GIDEON WELLS

Clinical and anatomical study of the lipoidal nephrosis. PAUL GOVAERTS AND R. CORDIER. *Bull. acad. roy. med. Belg.* [5], 8, 510-48(1929).—Nephrosis cannot be explained by an isolated degeneration of the kidney; it is due to grave metabolic disturbances of the body as a whole. This is indicated by a diminution of the osmotic pressure of the blood proteins, on account of hypoalbuminosis. Hence a diet rich in proteins is recommended. R. BEUTNER

The pathogenesis of diabetes. JEAN LA BARRE. *Bull. acad. roy. med. Belg.* [5], 8, 758-88(1928).—The venous blood from the pancreas of a normal dog is introduced by a pancreatic-jugular anastomosis into a depancreatized dog; the hypoglycemia in this latter disappears which proves the presence of insulin in normal blood. The excitation of the right vagus increases the insulin content of the pancreatic blood, which is shown by the hypoglycemia brought about in a depancreatized dog by infusion of this blood. By cross-circulation expts., using the method of Hymans, B. proves that hyperglycemia stimulates the nerve center which regulates insulin secretion. R. BEUTNER

Sugar tolerance in arthritis. II. Arthritis of the menopause. BENJAMIN H. ARCHER. *Arch. Internal Med.* 44, 238-43(1929); cf. C. A. 23, 4503.—In 26 cases of arthritis of the menopause 70% showed diminished sugar tolerance, which may or may not be due to the chronic diseases of the joints present. J. B. BROWN

Inorganic serum sulfates in renal insufficiency. A comparative study of blood urea and creatinine. The effect of diuresis on serum sulfates. F. G. WAKEFIELD. *Arch. Internal Med.* 44, 244-51(1929); cf. C. A. 23, 4239.—In renal insufficiency serum sulfate concn. is increased when blood urea is above 70 mg. per 100 cc. In 5 cases of chronic nephrosis inorg. serum sulfate was normal. J. B. BROWN

Tetany from hyperrespiration. VIRGINIO PORTA. *Boll. soc. ital. biol. sper.* [10], 3, 1282-6(1928).—All the symptoms of tetany may be induced by very profound respiration, the exhalations to be especially complete, voluntarily by man, or by means of a pulmator on animals. A series of tests was made on human beings as well as on cats and rabbits. The CO_2 content was lowered 60% and reserve alk. 14%; the pH increased slightly; the Ca increased slowly, but steadily by reason of increase in Ca proteins, Ca^{++} decreasing (this was the cause of the motor disturbances); glucose increased somewhat and was probably associated with hyperadrenalinemia. Air with 2.5 to 5% CO_2 did not produce tetany, while pure O_2 , unless stopped within 3 or 4 min., produced delirium. Alkalosis is a less factor than the vasomotor disturbances because of the hyperventilation of the lungs. A. W. CONTIERI

The question of sensitiveness to glycerol bouillon. W. KELLER AND W. DÖLTER. *Beitr. klin. Tuberk.* 69, 444-71(1928).—Among 93 tuberculin-pos. children 83 reacted to injections of concd. glycerol bouillon (Höchst) and of 17 tuberculin-pos. adults 16 reacted, while of 112 tuberculin-neg. children none reacted to the bouillon. Microscopically the site of reaction to the glycerol bouillon proved to be tuberculoid in nature as a granulation tissue in the cutis. The basis for this behavior of glycerol bouillon was not definitely detd. H. J. CORPER

The actual reaction of pus in chronic and acute abscesses. B. KOLDAYEV AND B. KUTZENOK. *Beitr. klin. Tuberk.* 69, 472-8(1928).—Colorimetric detn. of the H-ion concn. of pus with the indicators of Clark and Lubs simplified by Krontowski was made in 51 individuals. Closed tuberculous abscesses revealed a H-ion concn. within the limits of pH 6.8 to 7.2, while acute nontuberculous abscesses showed 5.8 to 6.8. Mixed infection shifted the actual reaction of the pus in tuberculous abscesses toward the acid side, while with mild mixed infection as well as in the presence of outspoken cachexia the shift was insignificant. In the presence of severe mixed infection with persistent devitalizing fever and a rich purulent discharge the pH values of acute pus were approached in individual cases. It is believed that the findings can be of practical differential diagnostic value. H. J. CORPER

Intracutaneous injections of perspiration and tuberculosis. E. DORN. *Z. Tuberk.* 51, 134-7(1928).—Stimulated by the Wildbolz urine test D. tested the perspiration of tuberculous individuals for the elicitation of sp. reactions. The perspiration was obtained by means of a syringe from the axilla or brow of the patient and the supernatant fluid used after permitting the solid epidermal material to settle out. Injections were given intracutaneously into the upper arm in 0.2 cc. amts. The expts. were tried on auto- and hetero-donors and of 171 tests 81.3% proved theoretically correct. As with the tuberculin skin test there occurred a local reaction at the site of injection

but general and focal reactions were absent. Pos. reactions as a rule indicated an active tuberculosis in the donor and a neg. the reverse. The diagnosis of an active tuberculosis in the perspiration donor is possible in the majority of moderately severe and severe tuberculous cases and when the recipient is tuberculin hypersensitive. An early diagnosis of active tuberculosis was not possible by means of the intracutaneous injection of perspiration.

H. J. CORPER

Serological studies in experimental yaws. OTTO SCHÖBL. *Philippine J. Sci.* 40, 53-61 (1928). Experiments concerning the yaws antigen which produces a positive Wassermann reaction when injected in suitable experimental animals. OTTO SCHÖBL AND BRUCE A. TANABE. *Ibid* 57-68. Is the Wassermann reaction provoked in Philippine yaws, yaws vaccination specific? ISAO MIYAO. *Ibid* 71-4. Following the subcutaneous immunization with yaws vaccine is the skin tissue proper responsible for the production of Wassermann reaction or do other tissues also participate? *Ibid*

The relation of the Wassermann and the Kahn reactions with regard to treponema antigen. ONOFRE GARCIA. *Ibid* 79-87. Summary of serologic studies in experimental yaws. OTTO SCHÖBL. *Ibid* 89-90. Immunologic relation between yaws and syphilis. OTTO SCHÖBL AND ISAO MIYAO. *Ibid* 91-108. E. J. C.

Studies on dehydration following edema. III. The sedimentation test during the reduction of cardiac edema. ESKIL KYLIN. *Z. ges. expil. Med.* 64, 217-26 (1929); cf. *ibid.* 23, 637.—In cardiac decompensation with edema the sedimentation rate of erythrocytes is generally normal or somewhat prolonged. During loss of the edema the rate accelerated, reaching a max. as the edema disappears, becoming normal gradually after a period of several weeks. K. considers that these variations are due to chemical changes in the plasma, particularly in the protein fraction.

F. L. DUNN

Ketonuria in liver disease. GERHARD SCHERK. *Z. ges. expil. Med.* 64, 281-7 (1929). Acetone and β -hydroxybutyric acid excretion is unchanged in liver disease. Following 10 to 15 g of β -hydroxybutyric acid to patients with liver disease showed no increase in excretion over that observed in normal individuals or in patients with diabetes than liver disease. Ketonuria cannot be used as a test for liver function because other organs in the body can oxidize ketone bodies.

F. L. DUNN

The hydrogen-ion concentration of blood and urine in health and disease. RUDOLF ALINT. *Z. ges. expil. Med.* 64, 288-94 (1929).

F. L. DUNN

Glucolysis in spinal fluid. OTTO J. NIELSEN. *Z. ges. expil. Med.* 64, 522-33 (1929).—The glucolytic process was studied in 37 fluids, 12 of which were normal, 15 from cases of tuberculous meningitis, 1 serous meningitis, 1 brain tumor, 2 uremia. The glucolytic process depends upon exogenous factors. It began usually only after 32 days. Cells and bacteria not glucogenic in themselves did not affect the rate. The H-ion concn. did not influence the rate.

F. L. DUNN

The chemistry of pathological fatty liver. D. YUASA. *Z. ges. expil. Med.* 64, 658-65 (1929).—The I number and the periodine (Margosches) number were detd. for the fat in 51 livers together with the deposit fat. Pathol. changes in liver fat are accompanied by similar changes in deposit fat and Y. concludes that the fatty liver is not due to a simple transfer of deposit fat into the liver.

F. L. DUNN

The mineral content of the blood in malignant and benign tumors. A. SCHEPERS-TINSKY AND M. KAFITIN. *Arch. Gynäkol.* 136, 379-87 (1929); cf. *C. A.* 23, 3967.—The mineral content of the blood was detd. in 60 women with fibroma of the uterus and in 60 women with cancer. In fibroma cases the Ca content was usually at the same level as in normal women. Removal of the fibroma was followed by an increase in the Ca content but not above the upper limit of normal. In cases where the Ca content was high the removal of the fibroma caused a fall to normal. In malignant tumors the Ca content was usually within normal limits but an inconsiderable percentage of cases showed a slight increase. In fibroma the K content was within normal limits in the majority of cases but was somewhat decreased in 35% of the cases. Removal of the fibroma was followed by an increase of K content in those cases in which it was decreased before the operation. In malignant tumors the K content was within normal limits in the majority of cases but was somewhat decreased in 40% of the cases. In fibroma the P content was usually within normal limits. After removal of the fibroma it reached the normal limit if it had been low before. In malignant tumor the P content was noticeably decreased in 70% of the cases. The Na and Cl contents were found within normal limits both in fibroma and in malignant tumor. HARRIET F. HOLMES

Isoagglutination in the newborn and its relationship to icterus neonatorum. GEORG LENART AND STEFAN BIRÓ. *Jahrb. Kinderheilk.* 124, 77-87 (1929); cf. *C. A.* 23, 1955.—An intense icterus neonatorum occurs twice as frequently when maternal and fetal

bloods are incompatible as when they belong to the same blood group. In spite of group identity 5 of 56 maternal sera agglutinated the erythrocytes of their offspring. Atypical isoagglutinins were found in the sera of several infants. It is possible that in some cases agglutination and hemolysis may be due to the existence of autochthonous fetal isoagglutinins, or there may be unrecognized sub-groups in the established blood groups.

The significance of the decrease of sugar in the cerebrospinal fluid in tuberculous meningitis, and its relationship to the lactic acid content and to hydrogen-ion concentration. J. GELDRICH. *Jahrb. Kinderheilk.* **124**, 159-87(1929).—In tuberculous meningitis the sugar in the spinal fluid at first decreases, and then oscillates between 10 and 30%, or in occasional instances rises again to normal heights. On the other hand, lactic acid rises constantly throughout the illness, increasing from 15 to about 120 mg. percent. The increase of lactic acid is probably due to lactic fermentation. From a clinical point of view, the detn. of lactic acid is of more value than that of sugar. Electrometric detn. of the p_H shows that the reaction becomes more acid, reaching a final value of p_H 7.22 to p_H 7.08. A decrease of sugar and an increase of lactic acid are pathognomonic of meningitis, but are present in all meningitides, regardless of etiology.

ELEANOR M. HUMPHREYS

The chemistry of the cerebrospinal fluid. BÉLA STEINER. *Jahrb. Kinderheilk.* **124**, 188-94(1929).—The inorg. P in the normal cerebrospinal fluid varies between 1.4 and 1.6 mg. %. In meningitis the values lie between 1.7 and 3.0 mg. %. In brain tumor cases and in acute encephalitis the P is decreased. These observations gain in diagnostic value because other chem. studies give entirely neg. results. E. M. H.

Immunological studies of the constituents of *Bacillus dysenteriae* (Shiga). KAORI MATSUMOTO and TAKASHI SEKI. *Japan J. Exptl. Med.* **7**, 1-7(1928). Nucleoprotein prep. from autolysates of the dysentery bacillus is toxic and has antigenic potency as detd. *in vitro* and *in vivo*. The non protein residue is non toxic, and while it reacts species-specifically with antibacterial serum, it has no power to incite antibody formation.

ELEANOR M. HUMPHREYS

The mechanism of complement activity in hemolysis. KEIZO NAKAMURA. *Japan J. Exptl. Med.* **7**, 17-42(1928).—The degree of combination of sensitized erythrocyte. with complement is in general in proportion to the concn. of both substances. The hemolytic end-product inhibits this combination in proportion to its concn. The reaction equation derived from observations on the action of complement resembles that derived by Michaelis from observations on the action of saccharase.

ELEANOR M. HUMPHREYS

A biochemical study of the urine of cancer rats. YOSHIO KIMURA. *Japan J. Exptl. Med.* **7**, 113-34(1928).—This study of the chemistry of the urine of rats before and after tumor transplantation indicates an increased destruction of body proteins, paralleling the growth of the tumor. Total N and urea N are increased. Amino acids at first decrease and later increase. The ratio NH_4-N total-N decreases. There is a marked increase of allantoin, indicating an increased destruction of cell nuclei. According to the growth of the tumor, the output of salts rises, and the normal salt ratios are disturbed. The output of H_2SO_4 is but slightly increased, while neutral S shows a marked rise. The P_2O_5 increase parallels that of allantoin.

ELEANOR M. HUMPHREYS

Water loss in the expired air in cholera infantum. ALOIS BRATUSCH-MARRAIN. *Monatsschr. Kinderheilk.* **41**, 122-7(1928). In cholera infantum the diarrhea alone does not account for the great loss of water from the body. The marked increase in the depth of respiration and in pulmonary ventilation is associated with an increased loss of water in the expired air. The normal pulmonary water output of 200-400 g. per day rises to 500-1000 g. per day.

ELEANOR M. HUMPHREYS

The significance of refractometry in the differential diagnosis of pneumonias in childhood. HENRIETTE STAHLBERG. *Monatsschr. Kinderheilk.* **41**, 413-21(1928).—Refractometric determination of serum proteins is of value in the differential diagnosis of pneumonias in childhood. Serum protein is distinctly high in the tuberculous pneumonias, as contrasted with normal or sub-normal values in croupous and broncho-pneumonias. The sedimentation rate of erythrocytes does not parallel the serum protein level, but is increased in all pneumonias in proportion to their severity.

ELEANOR M. HUMPHREYS

Meningeal permeability and the diagnosis of meningitis in childhood. HERMANN ESSELBRÜGGE. *Monatsschr. Kinderheilk.* **43**, 45-53(1929).—Normally, the meninges are only slightly permeable to uranin, the Na salt of fluorescein. In meningitis this substance passes into the spinal fluid in relatively large amts. Uranin is a valuable aid in the early and differential diagnosis of meningitis.

ELEANOR M. HUMPHREYS

The oxygen-lack in experimental dehydration. M. FUKUYAMA. *Monatsschr. Kinderheilk.* 43, 337-40(1929).—By oxygen-lack F. means the amt. of O_2 required to complete the combustion of the intermediate org. substances excreted in the urine. In exptl. dehydration both the total N excreted and the amt. of O_2 required for complete oxidation are increased. Both the autoxidative processes and oxidation in general are impaired in acute dehydration. ELEANOR M. HUMPHREYS

Endemic goiter and its relation to iodine content of food. JAMES A. HAYNE. *Am. J. Pub. Health* 19, 1111-8(1929).—H. gives (1) the results of a recent survey of S. Carolina for goiter, (2) I_2 content of some S. Carolina vegetables, (3) comparison of (2) with the results published by McClendon for vegetables produced in Cal. and Oregon, (4) I_2 content of potatoes from different regions, (5) I_2 content of potatoes in relation to distance from sea, (6) I_2 in S. Carolina wells, springs, streams and city water and (7) I_2 content of potatoes in relation to soil areas. J. A. KENNEDY

Quantitative studies on the action of compound hemolysins. I. Graphical representation of the reaction between amboceptor, complement and blood corpuscles. RUDOLF GAHL. *J. Immunol.* 15, 549-70(1928). G. has developed a method of plotting hemolytic data. It is shown that curves representing the same percentage of hemolysis are parallel as long as the concn. of blood cells in the mixt. is not changed, and can be made to coincide by a shift of 1 or both coordinate axes. The shape of the curves is, therefore, independent of the concn. or titer of amboceptor and complement serum. This conclusion was derived under certain assumptions, the principal one being that the components are individual substances and not mixts. of 2 or 3. A comparison of the shape of such "characteristics" should, therefore, permit conclusions as to the purity of the components used for the tests. **II. Graphical interpretation of the work of previous investigators.** *Ibid.* 571-87. The exptl. results on compound hemolysins obtained by Arrhenius and Manwaring (*J. Infectious Diseases* 2, 460-84(1905)) were plotted by means of the system developed above. The resulting curves were of decidedly different character. Furthermore, when the various exptl. series of Manwaring are combined into a single plot, the various curves coincide in a general way but not as well as might be expected, if the assumptions stipulated above held without restriction over the whole range of the amboceptor and complement values covered by the expts.

III. New experimental material qualitatively discussed. RUDOLF GAHL, NORMAN DAVID AND ALICE KELLNER. *Ibid.* 16, 209-31(1929). One of the zones has been shown to be due to the presence of amboceptor in the complement. Regarding another zone, the thesis is proposed that it is due to the presence of complement in the amboceptor which would imply that heat inactivation, at least as ordinarily conducted, does not destroy all the complement contained in the amboceptor before inactivation. A 3rd zone was considered as representing the reaction between amboceptor and complement uncontaminated by side reactions. It was shown that this zone is utilized in the Wassermann test. It was also shown that the shape of the characteristics within this zone does not vary with the specimen of amboceptor and complement serum. Cross section curves show the typical S-shape observed by Manwaring. This shape is due to the varying resistance of the individual corpuscles toward lysis. The idea advanced in the 2nd part of this paper that the shape of the characteristic curves depends only on amboceptor and complement serum but not on the concn. and character of the blood corpuscles is supported by exptl. evidence. **IV. Quantitative interpretation of the characteristic curves.** RUDOLF GAHL. *Ibid.* 483-508. It is concluded that the complexities of these curves as they are experimentally obtained can be removed and the curves so simplified that they assume forms which are in harmony with the views proposed by Arrhenius on the reaction between hemolytic amboceptor and complement by introducing into the calcn. the assumption that neither heat-inactivated hemolytic amboceptor serum is free from complement nor complement serum from natural amboceptor. Geometrical methods for introducing suitable corrections were developed for this purpose. The application of such methods permits the quant. estn. of the contaminations. Heat-inactivated hemolytic amboceptor serum may, when undiluted, contain complement in quantities not much lower in order of magnitude than the complement serum. Its effect may nevertheless not be noticeable on the Wassermann reaction as long as potent amboceptor serum is used which permits a correspondingly high diln. Application of the law of mass action makes the construction of theoretical systems of characteristic curves possible. Only the exponents of mass law equations det. the shape of these curves. Such curve systems were calcd. under various assumptions regarding the chem. combination between amboceptor and complement and found to present typical pictures characteristic of each reaction. It is shown that when the corrections above referred to are applied to the curves derived from the

law of mass action in the opposite direction, complex curves result which agree with those experimentally obtained within the limits of explt. errors except in the region of complement deviation which the theory is not designed to cover. Rational systems for expressing strength of amboceptor and complement were proposed. J. A. K.

Chemical investigation of biologically active lipoids of tubercle bacilli. RUDOLPH J. ANDERSON. *Proc. Nat. Acad. Sci.* 15, 628-33(1929).—All the various lipid fractions isolated from tubercle bacilli possess the property of stimulating the proliferation of monocytes, epitheloid and giant cells and the subcutaneous injection of these products leads to a formation of tuberculous tissue. The factors responsible for this reaction have been identified as certain liquid satd. fatty acids. The substance possessing the greatest biol. activity is a *d*-rotatory fatty acid of the formula $C_{22}H_{42}O_2$ which has been named *phthioic acid*. J. A. KENNEDY

Effect of heating syphilitic serum and its protein fractions on precipitation reaction. M. NISHIO. *J. Infectious Diseases* 43, 148-55(1929).—Globulin from syphilitic serum, whether unheated or heated for 30 min. at 56°, gives pptn. results with the Kahn test, similar to those given by the same syphilitic serum after heating for 30 min. at 56°. Unheated albumin from syphilitic serum prevents or reduces pptn. given by the globulin. This property is not manifested when the albumin is heated for 30 min. at 56°. The protection to pptn. exerted by unheated albumin appears to be an inverse function of the concn. of the reacting substances of the serum and antigen. JULIAN H. LEWIS

Proteolytic enzymes in serum. XII. The significance of complement in blood coagulation. HANS J. FUCHS. *Z. Immunitäts.* 58, 14-21(1929); cf. *C. A.* 22, 2793.—Instead of using colloidal $Ca_3(PO_4)_2$ for the isolation of proserozyme as described by Bordet (*Ann. inst. Pasteur* 34, No. 9 (1920)) a colloidal suspension of $Mg(OH)_2$ was used. The adsorbed enzyme can be liberated with CO_2 . Plasma made uncoagulable with colloidal $Mg(OH)_2$ is devoid of complement action, but if coagulability is restored by the addn. of proserozyme, complement action is also restored. If proserozyme is added to enzyme-free plasma and the return of coagulability and complement action tested in the same vessel it is found that coagulation returns first and then hemolysis from the restored complement. JULIAN H. LEWIS

The antigenic function of human red blood cells of the various groups. KOJI OKABE. *Z. Immunitäts.* 58, 22-53(1928).—Antisera from rabbits immunized with human red cells of group O contained chiefly species sp. agglutinins. Although there were individual variations, cells of group O were agglutinated stronger in most cases. The possibility of cells of group O being the carriers of species sp. receptors is discussed. Such antisera either did not react with alc. red cell exts. or did so without group specificity. Immunization against group A red cells produced 3 types of antisera: (1) in which there was only species sp. agglutinins; (2) in which there was a specificity for group A cells; (3) in which there dominated agglutinins for group A, but in which there were also agglutinins for group B. The same relations existed when tested with alc. exts. of the red cells except that the species sp. antisera did not react with the exts. Antisera sp. for group A red cells reacted with heterogeneous alc. exts. Group B red cells also produced 3 types of antisera as follows: (1) those that contained species sp. antibodies; (2) those that reacted both with groups A and B; (3) those that contained agglutinins for group B. Beef serum is chiefly dominated with agglutinins for human red cells of group A, although some types contain agglutinins for group O. JULIAN H. LEWIS

Explanation of antiviral action. FRITZ SCHWEINBURG. *Z. Immunitäts.* 58, 53-78 (1928).—A crit. study is made of Besredka's antiviral from which it is concluded that this substance has no sp. action. After repeated inoculation and filtration of the culture medium a stage is reached where the filtrate not only inhibits the growth of bacteria but actually injures them. This action appears sooner according to the degree of departure of the H-ion concn. from the normal reaction, either to the acid or alk. side, and appears sooner for the homologous bacteria. The toxic action of the filtrates is due not only to an exhaustion of the culture medium but also to the development of injurious substances either from the medium itself or from the bacteria. The therapeutic action of these products is due to the unsp. curative action of foreign proteins. JULIAN H. LEWIS

The agglutinating and hemolytic action of serum on red cells changed by bacteria. Y. HIROTA. *Z. Immunitäts.* 58, 78-92(1928).—The organism isolated by Friedenreich (cf. *C. A.* 22, 3448) acts on normal human red cells so that they are agglutinated by agglutinins not demonstrable with normal cells. Low temps. are more favorable for this type of agglutination. The organism acts on cells of lower animals as well as those of man and makes them agglutinable by normal serum of species different from those

of the red cells. The abnormal agglutinability of red cells from lower animals is accompanied by an increased ease of hemolysis. The mechanism of the action of this organism, though not understood, is discussed. JULIAN H. LEWIS

Ultra-violet radiation of tetanus toxin, ricin, hemolytic complement and fatty acids. JOHANN SCHUBERT. *Z. Immunitäts.* 58, 106-22(1928).—Dried tetanus toxin is weakened by ultra-violet light almost as much as when in soln. When guinea pig complement is sepd. into its component parts it is found that the end piece, whether dry or in soln., is only slightly affected by ultra-violet light, while the middle-piece is very quickly destroyed when in soln. If the middle-piece is radiated while only moist it can be reactivated under certain conditions. Fatty acids and lipoids which are hemolytic when in colloidal soln. lose this property when radiated. JULIAN H. LEWIS

Antiprotein and antitoxin precipitins. E. HOEN, L. CHERTKOV AND V. ZIPP. *Z. Immunitäts.* 58, 143-58(1928).—Pptg. antisera obtained by the usual methods of giving 3 or 4 injections contain a relatively low titer of antibodies and can be titrated only by making dilns. of the antigen. However, if the immunizing process extends over a period of 6 to 8 months the antiserum has a high concn. of antibodies and can be titrated by making dilns. of the antiserum just as when antidiphtheria serum is titrated by the precipitin method. JULIAN H. LEWIS

The mechanism of chemotherapeutic curative processes. R. SCHNITZER AND W. SILBERSTEIN. *Z. Immunitäts.* 58, 159-72(1928).—Trypanosomes that are resistant to a chemotherapeutic agent disappear from the circulation of mice after treatment with the chemotherapeutic substance provided the mice were infected with both resistant and normal strains of trypanosomes which are immunologically identical. If such infected and treated mice develop a latent infection usually the resistant organisms are found in the circulation. These facts are given in support of the idea that chemotherapeutic cures are due not only to the action of the chemotherapeutic substance but also to an immunological factor. Latent infections are due to the development of a serum-fastness as well as a drug-fastness. JULIAN H. LEWIS

The antigenic structure of organ lipoids. A. J. WEIL. *Z. Immunitäts.* 58, 172-80(1928).—Antisera for organ lipoids obtained by immunization with alc. exts. of organs and hog serum react with various organ lipoids but with quant. complement fixation tests a certain amt. of relative organ specificity can be shown. JULIAN H. LEWIS

The relation of brain lipoids and their antisera. F. HEIMANN AND J. STEINFELD. *Z. Immunitäts.* 58, 181-92(1928).—Antisera for brain lipoids show a relative organ specificity toward either aq. or alc. exts. of organs. The specificity is less marked if the reactions are made with antigens to which cholesterol is added. JULIAN H. LEWIS

The antigenic nature of alcoholic extracts of tubercle bacilli. F. WEIGMANN AND W. LIESKE. *Z. Immunitäts.* 58, 222-43(1928).—See C. A. 22, 2611. J. H. L.

The physico-chemical relations of agglutinins. LEO OLITZKI. *Z. Immunitäts.* 58, 244-54(1928).—By fractional pptn. of the globulin of immune sera no difference in the precipitability of O and H agglutinins could be demonstrated. Immune sera freed of euglobulin showed a higher resistance of the H agglutinin to heat. The O agglutinin is very sensitive to pH changes while the H form is resistant. CHOH has a more destructive action on the agglutinins of an immune serum the more concd. the serum is, while heat has the same action irrespective of the concn. of the serum. This indicates that CHOH acts primarily on serum globulin while heat acts directly on the agglutinin. JULIAN H. LEWIS

Thrombocytobarin against bacteria. M. N. LEBEDEWA. *Z. Immunitäts.* 58, 255-63(1928).—Only spirilla and vibrios show the ability to incite the formation of thrombocytobarin on immunization. This antibody is sp. Dead or injured organisms lose their power to be laden with blood platelets in the presence of thrombocytobarin. JULIAN H. LEWIS

Influence of the surrounding temperature on the toxic effect of foreign serum and red cells on cold-blooded animals. K. A. FRIEDR. R. E. MESSIK AND E. M. SCHACHUNJANZ. *Z. Immunitäts.* 58, 263-70(1928).—Foreign serum and red cells are much more toxic for frogs at room temp. (8°) than at 20°. With red cells this apparently is due to an increased phagocytosis and intracellular destruction at the higher temp. No hemolysis occurs in the circulation or in frog serum at 37°. The increased toxicity of serum is due to an increased lability of the cell and blood colloids at higher temps. Active physico-chem. substances change the grade of dispersion of frog serum colloids much easier and quicker if the temp. is raised. JULIAN H. LEWIS

The specific antigenic function of organs. E. WITEBSKY AND J. STEINFELD. *Z. Immunitäts.* 58, 271-96(1928).—The injection of a brain emulsion into the rabbit produces an antiserum which is highly organ sp. and only slightly species sp. Such a

serum reacts not only with the homologous brain tissue but also with the brain tissue of all other animals, either in its native state or after boiling. An exception is beef brain which produces an antiserum which reacts only with native beef brain. Kidney and liver tissue produces chiefly species sp. antisera. Heat destroys the reacting power of these tissues. Another exception is that of beef liver which produces an antiserum that is chiefly organ sp. and which will react with boiled beef liver. With the exception of anti-beef brain sera, anti-brain sera react with alc. exts. of brain as well as with aq. exts. Anti-kidney sera have no lipid antibodies. Anti-liver sera usually contain antibodies which react with lipoids in general, although some contain either organ or species sp. antibodies. Hemolysins and serum precipitins are not necessarily produced by organ immunization. They are never found in anti-brain sera. All rabbits do not produce organ antibodies.

JULIAN H. LEWIS

The antigenic function of the crystalline lens. E. WITEBSKY. *Z. Immunitäts.* 58, 297-311(1928).—Immunization with cryst. lens produces organ sp. antisera which react with aq. and alc. exts. of the lens of all animal species. The injection of alc. exts. of beef lens combined with hog serum produces an antiserum which reacts with lipoids in general and without organ sp. antibodies. The alc. ext. alone produces no lipid antibodies. Guinea-pig lens and brain contain organ sp. lipoids and the Forssman heterogenic antigen.

JULIAN H. LEWIS

The characteristics of the flocculation in mixtures of toxin and antitoxin. M. LURIE, A. ROSENBLATT AND N. KOSSAREW. *Z. Immunitäts.* 58, 448-60(1928).—An explanation is sought for abnormal results in the flocculation titration of diphtheria antitoxin. Most of them arise from physico-chem. alterations of the bouillon in which the toxin is produced. Over-heating of the bouillon, sterilization at a p_H of 5.5 and lower, putrefactive changes in meat from which the bouillon is made, the nature and concn. of electrolytes all have marked influences on the results of the flocculation test. With anaphylaxis tests it can be shown that the flocculate contains serum as well as toxin proteins.

JULIAN H. LEWIS

The role of the reticulo-endothelial system in the activation of chemotherapeutic substances. I. L. KRICHEVSKII. *Z. Immunitäts.* 59, 1-16(1928).—The spleen, through its reticulo-endothelial system, takes up chemotherapeutic substances and gives them off gradually into the circulation. In the absence of the spleen active adsorbing substances, such as agar and the infecting organisms themselves, when injected along with the chemotherapeutic substances may take up the drugs and thus replace the function of the spleen. This activating action of the reticulo-endothelial system is independent of its protective action against infection.

JULIAN H. LEWIS

The relation of group specific structures in man and animals. L. HIRSZFELD AND W. HALBER. *Z. Immunitäts.* 59, 17-51(1928).

JULIAN H. LEWIS

Production of antibodies after blockade of the reticulo-endothelial system. W. JELIN, O. ROSENBLATT AND S. BRINN. *Z. Immunitäts.* 59, 52-65(1928).—Several different colloidal substances were used to produce blockade and to det. their effect on antibody production for various antigens. In general there was an inhibition, indicating the active role that the reticulo-endothelium system plays in immunization.

JULIAN H. LEWIS

The thermostability of agglutinins. L. SILBER AND NIKOLSKAJA. *Z. Immunitäts.* 59, 66-73(1928).—Heat does not affect agglutinins when the serum is heated in the presence of Bayer 205, HCl and other substances which retard coagulation.

JULIAN H. LEWIS

Reaction speed of toxin and antitoxin in fractional saturation. S. SCHMIDT. *Z. Immunitäts.* 59, 82-129(1928).—A study of the Danysz phenomenon in which the Ramon flocculation test was used to det. neutralization.

JULIAN H. LEWIS

The protective action of antipyrine against anaphylactic shock. MOKICHI MATSUDA. *Z. Immunitäts.* 59, 319-25(1928).—Phys. or chem. treatment of guinea pigs does not in most cases protect against anaphylactic death. Adrenaline, $CaCl_2$ and concd. NaCl are not const. in their protective action. The intravenous injection of $1/2$ the lethal dose of antipyrine 5-10 min. before the intravenous injection of antigen protects sensitized guinea pigs from about 5 lethal doses of the antigen.

J. H. L.

The serozyme content of blood platelets, a new coagulation theory. HANS J. FUCHS. *Z. Immunitäts.* 59, 424-33(1928).—Blood platelets contain serozyme and cytozyme. Serozyme plus an excess of cytozyme has no complement action. Thrombin formation resulting from blood platelet disintegration occurs quicker than with the components from the circulating blood because of the "optimal preformed" conditions in the former and the presence of antiprothrombin in the latter.

JULIAN H. LEWIS

Isohemolysin in human sera. I. Reactivation. II. The relative strength of

α - and β -lysin. OLUF THOMSEN AND ALEX THISTED. *Z. Immunitäts.* 59, 479-80, 491-500(1928).—Isohemolysins have the same systematic relations as the isoagglutinins. They must be demonstrated with fresh sera and fresh red cells. They have a comparatively low titer. Isohemolysin that has been inactivated by heat or by standing can be reactivated with guinea-pig serum or human serum, although in the latter case one may encounter antihemolysins. Sera of the A- β group are not as active as those of the B- α group. In the O $\alpha\beta$ group the α -component is more active than the β -component.

JULIAN H. LEWIS

Preparation of a syphilitic antigen from *Sp. pallida*. R. R. HOELTZER AND W. J. POPOFF. *Z. Immunitäts.* 59, 501-9(1928).—Rabbits immunized with an ext. of spirochetes after the method of Klopstock gave a pos. Wassermann reaction. The reaction was best obtained with an alc. ext. of the spirochetes. This ext. also gave pos. reactions with human serum if pos. reactions were obtained with the usual Wassermann antigens, but neg. sera also gave pos. reactions.

JULIAN H. LEWIS

The complement titer of guinea pigs on acid and alkali diets. W. E. HUGHES AND H. ZAIN. *Z. Immunitäts.* 59, 517-20(1928).—Acid or alk. diets had no effect on the complement titer. In one case on an acid diet (hay) in which a lipemia developed there was a decrease in the titer.

JULIAN H. LEWIS

The question of the oxidation of glucose in phlorhizin glucosuria. WALTER M. BOOTHBY, CHARLES M. WILHELMJ AND H. ELLIS C. WILSON. *J. Biol. Chem.* 83, 657-79(1929).—"After several days of complete phlorhization the basal metabolic rate in dogs is markedly elevated and may reach 90% above the normal rate. The administration of glucose to the completely phlorhizinized dog causes a definite decrease in the high level of heat production and a definite rise in the respiratory quotient. If this rise is taken as indicating an increase in the oxidation of glucose, it is found that 18-25% of the ingested glucose is oxidized in 5-7 hrs. In phlorhizinized dogs, when proper precautions are taken, the amt. of glucose accounted for by oxidation and excretion in the urine will not exceed the amt. given; therefore, the results from these expts. do not yield evidence in favor of the assumption that carbohydrate is formed from fat."

A. P. LOTHROP

Muscle phosphorus. III. The distribution of acid-soluble phosphorus compounds during parathyroid tetany. H. A. DAVENPORT, H. H. DIXON AND S. W. RANSON. *J. Biol. Chem.* 83, 741-6(1929); cf. *C. A.* 23, 1654.—No changes were found in acid-sol. P content or in the partition of P compds. in the gastrocnemii of parathyroidectomized dogs and dehydration of these muscles was not demonstrable. Changes in phosphate metabolism during parathyroid tetany involve a source of P other than that of striped muscle.

A. P. LOTHROP

The chemical analysis of bacteria. The chemical aspects of immunity. GEORGES LOEWY. *Presse méd.* 37, 752-3(1929).—A general review.

A. E. MEYER

Problems in pathological fat formation. II. The problem of lecithin. GEORG, ROSENFELD. *Biochem. Z.* 211, 270-5(1929); cf. *C. A.* 23, 5235.—The accumulation of lecithin in the livers of P-poisoned animals is considered due to migration of lecithin from body depots.

S. MORGULIS

The mitogenetic behavior of blood from carcinoma patients. LYDIA GURVICH, S. ZALKIND, A. LAPZINSKII AND A. MARTINOV. *Biochem. Z.* 211, 362-72(1929).—The blood of cancer patients as well as of cancerous mice loses its mitogenetic activity; this is attributed to an inhibition of the enzymic processes upon which the activity of the blood depends.

S. MORGULIS

The erythrocyte with special reference to punctate basophilia, diffuse polychromasia and reticulation. W. E. COOKE. *Folia Haematol.* 38, 194-7(1929).—It is probable that the stainable substance is not nuclear but a hemoglobin compd., and that the above conditions vary only quantitatively. When these conditions occur under ordinary staining conditions they point to increased permeability, or a defect in the lipid envelope of the erythrocyte rather than to immaturity.

J. T. M.

The blood picture and the eosinophilia in trichinellosis. G. WEINDRACH. *Folia Haematol.* 38, 380-4(1929).—It is suggested that the eosinophilia may be due to a paralyzing effect of the toxin produced by the parasite on an internal secretion of the spleen.

JOHN T. MYERS

Studies on carbon dioxide. V. The mechanism responsible for the preserving action of carbon dioxide on diphtheria toxin. WAYNE N. PLASTRIDGE AND LEO F. RUTTER. *J. Bact.* 18, 101-5(1929); cf. *C. A.* 23, 4965.—Diphtheria toxin may be preserved over comparatively long periods of time at a temp. of 37° when placed under CO₂, providing sufficient CO₂ to produce an acid reaction is not present. Within the limits of p_H 7.0 and 9.0, the lower the H-ion concn. of the toxin soln. the more rapid

is the rate of destruction of the toxin by mol. O in the absence of CO_2 . The toxicity of filtrates stored under N decreases less rapidly than the toxicity of solns. having the same reactions but stored under a small quantity of air, but the rate of destruction under N is greater than under CO_2 . The opt. p_{H} for the preservation of toxin is 7.0. The preserving effect of CO_2 is due to its control of the p_{H} and prevention of oxidation by mol. O.

JOHN T. MYERS

Studies on dental caries, with special reference to the aciduric organisms associated with the process. I. Isolation and description of the organisms. TOSHIKI MORISHITA. *J. Bact.* 18, 181-98(1929).—High acid-tolerating organisms are almost always present in tooth enamel and saliva of persons with dental caries. They may produce enough acid to cause decalcification of enamel *in vitro* but this has not been substantiated *in vivo* as yet.

JOHN T. MYERS

The activating action of a phenol-alcohol mixture on lipid antigens. H. SACHS AND G. SOLLAZZO. *Zentr. Bakt. Parasitenk.*, I Abt., 112, 325-35(1929).—Heterogeneous lipid antigens so finely dispersed that they do not react with antisera may be made to bind complement strongly by the addn. of a mixt. of 2% phenol in alc. Phenol-alc. dild. with NaCl soln. will serve as antigen in the Wassermann reaction, because it partially flocculates the serum lipoids, rendering them antigenic. J. T. M.

Is the sterilization of the organism by the use of therapeutic doses of "Naganol" (Bayer 205) possible in trypanosomiasis of the camel? S. A. AMANSHULOV, P. N. ARBUZOV AND A. SHURAVLEV. *Zentr. Bakt. Parasitenk.*, I Abt., 113, 36-8(1929).—Some trypanosomes become tolerant.

JOHN T. MYERS

A new method of producing bacterial vaccines. J. VIGNATI. *Zentr. Bakt. Parasitenk.*, I Abt., 113, 71-3(1929).—Bacterial suspensions were made in 5 to 10% CuSO_4 solns., allowed to stand at room temp. for 4 to 6 hrs., centrifuged and dild. with the following soln.: $\text{Na}_2\text{S}_2\text{O}_3 \cdot 5\text{H}_2\text{O}$ 25 g., Na_2SO_3 2.5 g., distd. water 1000 cc. These vaccines were just as antigenic and less toxic than heat-killed cells. J. T. M.

Antibody production by antigens contained in the cell membrane. ANNA-LISA ANNELL. *Zentr. Bakt. Parasitenk.*, I Abt., 113, 122-30(1929).—Living or killed culture of the cholera vibrio in collodion sacs placed in the peritoneal cavity of rabbits produced agglutinins and lysins. Tubercle bacilli produced hypersensitization. J. T. M.

The prevention of bacterial panagglutination of erythrocytes (Thompsons' phenomenon), a source of error in blood grouping. LILY SANDSTRÖM. *Zentr. Bakt. Parasitenk.*, I Abt., 113, 256-61(1929).—A concn. of 0.01 to 2.0% of formalin will prevent this non-sp. agglutination of human erythrocytes.

JOHN T. MYERS

The nature of serum hemolysins. L. GÓZONY AND F. HOFFENREICH. *Zentr. Bakt. Parasitenk.*, I Abt., 113, 277-84(1929).—Hemolytic serum of high titer was extd. with acetone and ether, dried, extd. overnight with distd. water and centrifuged. The aq. ext. was adsorbed with a suspension of cholesterol and erythrocyte lipoids, centrifuged and the lipoids were removed by washing alternately with acetone and benzene 2 or 3 times. Two types of needle-like crystals remained after this washing, which could be sepd. by slow centrifugation; a large type which hemolyzes at a diln. of 1:2,000,000 and a small type which hemolyzes at 1:500,000. Neither gave protein reactions. They behave like lipases.

JOHN T. MYERS

Humoral instability: causes, effects and remedies. AUGUSTE LUMIÈRE. *Rev. gén. colloïdes* 7, 158-65(1929).—Purely speculative.

GEO. H. SMITH

Serological studies on blood proteins. TANDO MISAO. *Japanese J. Med. Sciences*. VI. *Bacteriology and Parasitology* 1, 1-51(1929).—Plasma fibrinogen, globulin, albumin and hemoglobin are antigenic in decreasing strengths as here given, plasma and whole serum being intermediate between globulin and albumin. Each of these four proteins is specific, hemoglobin being very distinct from the 3 plasma proteins, which are only relatively specific, the globulin coming between the albumin and the fibrinogen and being especially related to the latter. All four show species specificity but the hemoglobin less than the plasma proteins. The "artificial globulin" of Moll is also antigenic, and has its own specificity, nearer the albumin than the globulin. Antiserum against the most carefully purified hemoglobin produces not only precipitins for hemoglobin but also for plasma proteins, which M. attributes to an assumed transformation of hemoglobin into plasma proteins after injection. Globin is about as actively antigenic as hemoglobin, with the same species specificity, but shows chem. specificity from hemoglobin; it is not particularly toxic.

H. G. WELLS

No lead in tumor tissue after intravenous injection of colloidal lead. M. C. RAINHARD AND K. W. BUCHWALD. *J. Cancer Research* 13, 239-41(1929).—Colloidal lead (diapsorol or phosphate) was injected intravenously into mice with spontaneous tumors, which were later removed and examd. for Pb by chem. and spectral analysis.

The results were entirely negative. This is in accordance with the results of Martland and Sochocky.

Lactic acid formation in tumor tissue. HELEN R. DOWNES. *J. Cancer Research* 13, 268-82(1929).—When tumor tissue from human cases is incubated with nutrient soln. contg. glucose, lactic acid is formed in widely varying amts., but nearly always in excess of the amt. that would be formed by normal muscle or embryo hash. When rat tumor tissue is subjected to conditions of temp. or p_H that render it incapable of being transplanted, the lactic-acid-forming ability of the tissue is not altered. Radiation *in vivo* and *in vitro* does not affect the lactic-acid-forming ability of animal tumors. Rat tumors which can be kept on ice for a week and still be successfully transplanted lose their lactic-acid-forming power rapidly with time, and have lost it very nearly completely at the end of 7 days. Glucose, maltose and mannose serve tumor tissue equally well as lactic-acid precursors. Fructose and hexosephosphate are less readily available, and sucrose, lactose, galactose and glycogen cannot be used by tumor tissue at all.

H. G. WELLS

Serological differentiation of steric isomers (antigens containing tartaric acids). II. K. LANDSTEINER AND J. VAN DER SCHEER. *J. Exptl. Med.* 50, 407-17(1929); cf. *C. A.* 22, 3927.—In continuation of studies on the stereochem. specificity of serum reactions, antigens were examd. contg. the acyl radicals of the *l*-, *d*- and *meso*-tartaric acids. Immune sera can readily be obtained which differentiate sharply the 3 antigens identical in every other respect but possessing stereoisomeric groups. Since the tartaric acids by their chem. constitution belong to the same class of substances as sugar acids the results have a bearing upon the question of the specificity of natural antigens contg. carbohydrates such as have been described by Avery and Heidelberger. Heating ≈ 5 g. tartaric acid and 13.8 g. $p\text{-O}_2\text{NC}_6\text{H}_4\text{NH}_2$ at 170° gives approx. 12 g. *p*-nitrolar-tranilic acid; the *l*-deriv., yellow, m. $211-2^\circ$, $[\alpha]_D^{25} -120^\circ$ (1% in MeOH); *d*-deriv., m. $212-3^\circ$, $[\alpha]_D^{25} 120^\circ$ (1% in MeOH); *meso*-deriv., m. $193-4^\circ$. Reduction with Zn and HCl give the corresponding *p*-NII, derivs. which do not m. at 285° ; the *l*-deriv. has $[\alpha]_D^{25} -98.6^\circ$ (480 mg. + 2.6 cc. *N* HCl made up to 15 cc.); the *d*-deriv. has $[\alpha]_D^{25} 99.2^\circ$ under the same conditions. The diazo compds. from these were coupled with proteins as in the earlier paper.

C. J. WEST

Antibody formation by polysaccharides. SHOJI NISHIMURA. *J. Exptl. Med.* 50, 419-29(1929).—By complement-fixation tests it has been clearly demonstrated that the sera of rabbits immunized with inulin, sol. starch and dextrin contain sp. antibodies. All these immune sera gave a negative pptn. reaction. The kind of dextrin which has a constitution very near to that of starch has an antigenic property, but those in a state of further decompn. do not give rise to antibodies. All of the 3 kinds of polysaccharides have power to produce antibodies without any vehicle. Dextrin is the only one of the 3 that gives rise to immune bodies more readily when pig serum is added to it. Regarded as antigens, inulin stands first and sol. starch and dextrin are next in order. All 3 kinds of polysaccharides that were employed gave negative protein color reaction; all of them, however, contained N. It is suggested that in the production of immune bodies by these 3 kinds of polysaccharides, proteins might play the part of the vehicle. This is, however, still to be detd.

C. J. WEST

Acido-ammoniuria in acidosis and alkalosis. L. BETHOUX AND P. MOUNIER. *Arch. mal. app. diges.* 19, 67-90(1929); *J. Am. Med. Assoc.* 92, 1638.—The term acido-ammoniuria is used to express the total acidity of urine, comprising the acidity due to acid PO_4 , org. acids and combined NH_4 salts. It is detd. by titrating urine with 0.1 *N* NaOH after the addn. of formaldehyde and multiplying the result by 10 to express it in *N* NaOH per l. In normal adults on a mixed diet, it averages 80 cc. *N* NaOH per l. On a meat diet, in fasting or inanition, in extreme muscular fatigue and in pregnancy, it increases physiologically up to 100. It is higher in children than in adults. On a vegetable diet and after intake of alkalis or org. acids it decreases to 50. The relation between acido-ammoniuria and the concn. of the urine, called the acido-ammoniuria coeff., is used to express the degree of acidosis. In normal persons this is 5; in slight acidosis it is 6-8, medium acidosis 9-11 and severe acidosis above 12. R. C. W.

Spectrographic chemical analysis [of Rb in blood] (RAMAGE) 7.

H—PHARMACOLOGY

A. N. RICHARDS

The results obtained by trypanoxyl in the treatment of chronic human trypanosomiasis. F. VAN DEN BRANDEN. *Bull. acad. roy. méd. Belg.* [5], 8, 332-41(1928).—

Trypanarsyl is a drug which has the same chem. constitution as tryparsamide. B. uses it with excellent success in 149 cases of chronic trypanosomiasis in the Belgian Congo.

R. BEUTNER

Opium addiction. VII. A comprehensive study of the scopolamine treatment for morphine addiction. ARTHUR B. LIGHT AND EDWARD G. TORRANCE. *Arch. Internal Med.* 44, 194-203(1929); cf. C. A. 23, 4506.—The changes in morphine addicts following scopolamine treatment include: loss of wt., temp. rise, albuminuria, slight leucocytosis, concn. of blood, rise in blood p_H and lactic acid, and fall in CO_2 capacity. Numerous other tests, including complete blood analysis, showed no changes. J. B. B.

Blueberry leaf extract overdosage. LEONARD B. SHPNER. *Arch. Internal Med.* 44, 204-8(1929).—Excessive doses of blueberry leaf ext., "myrtomel," when administered orally to partially pancreatectomized dogs are non-toxic. J. B. BROWN

Toxic cirrhosis of liver due to cinchophen. HERBERT S. REICHLE. *Arch. Internal Med.* 44, 281-8(1929).—Two new cases of cinchophen toxicosis are described, along with 47 cases reviewed from the literature. The therapeutic use of this drug should be reevaluated. J. B. BROWN

"Noctal and Pernocton." III. Behavior in the organism. FR. BOBDECKER AND H. LUDWIG. *Arch. expl. Path. Pharmacol.* 139, 353-6(1929); cf. C. A. 19, 1311.—"Noctal" (5-isopropyl-5- β -bromoallylbarbituric acid) and "Pernocton" (5-*sec*-butyl 5- β -bromoallylbarbituric acid) are chiefly converted in the animal organism to acetylonyl compds. (found to be non-toxic). The corresponding malonylureidoacetic acids (into which "Noctal," "Pernocton" and their acetylonyl compds may be changed) are also non-toxic. IV. The determination of the activity of similar barbituric acids. *Ibid* 357-60.—The β -bromoallyl group as a substituent group in the synthesis of highly active hypnotics is not alone important. The following compds., tested on rabbits and dogs in doses of 0.025-0.04 g. per kg., are also strong hypnotics: 5-isopropyl-5- γ -bromoallyl-, 5-isopropyl-5- β -chloroallyl-, 5-isopropyl-5- β , γ -dibromoallyl-, 5-di-(β -bromoallyl)- and 5,5-di-(β -chloroallyl)-barbituric acids. V. The influence of the structure of the alkyl group on the activity. *Ibid* 361-73.—Barbituric acids having an asymmetric C atom in a branched alkyl substituent (the "Pernocton" type) are the most active of all previously known hypnotics with respect to dosage and rapidity with which narcosis sets in. The physiol. and pharmacol. properties of "Pernocton" were investigated in detail.

B. C. BRUNSTETTER

The antagonism between adrenaline and ergotamine. ULF v. EULER. *Arch. expl. Path. Pharmacol.* 139, 373-8(1929).—Thunberg's methylene blue technic was used to demonstrate that ergotamine tartrate and ergotoxine phosphate in concns. of about 10^{-12} g. increase tissue oxidation. The effect of adrenaline, which strongly increases tissue oxidation, is completely annulled by doses of ergotamine of the same order of magnitude (10^{-10} - 10^{-12} g.).

B. C. BRUNSTETTER

Remarks on the paper of E. Geiger and E. Schmidt: "Influence of adrenaline on re-formation of sugar. E. WERTHEIMER. *Arch. expl. Path. Pharmacol.* 139, 378-80(1929).—Polemical. Cf. C. A. 23, 207.

B. C. BRUNSTETTER

Influence of adrenaline on re-formation of sugar. Answer to previous remarks of E. Wertheimer. E. GEIGER AND E. SCHMIDT. *Arch. expl. Path. Pharmacol.* 139, 381-2(1929); cf. preceding abstr.

B. C. BRUNSTETTER

The effect of diethylin on the circulation. U. G. BIJLSMA AND L. W. VAN ESVELD. *Arch. expl. Path. Pharmacol.* 144, 32-45(1929).—Diethylin (diethyl ether of glycerol) causes a rise which can be long sustained in blood pressure. This rise comes from a stimulation of the vasomotor center in the medulla oblongata. The effect of diethylin on the heart and blood vessels is small.

B. C. BRUNSTETTER

Are pentoses utilized in the animal organism? V. HENRIQUES AND A. ROCHE. *Compt. rend. soc. biol.* 100, 846-9(1929).—Arabinose ingested (2 g./kg.) or intravenously injected (1 g./kg.) into rabbits kept at const. temp. and anesthetized by urethan caused an increase in the respiratory quotient. Neither arabinose nor xylose can be substituted for glucose as a restorative in insulin hypoglycemia convulsions. B. C. B.

Glucosuria and insulin. GEORG FRICKE. *Z. ges. expl. Med.* 64, 81-94(1929).—The injection of insulin into normal or pancreatectomized dogs will produce a glucosuria at lower blood sugar levels than when no insulin is given owing to the action of insulin on the renal threshold.

F. L. DUNN

The action of amines. H. W. KNIPPING AND J. STEIGER. *Z. ges. expl. Med.* 64, 594-620(1929).—The total metabolism in dogs was detd. following the administration of the following amines: adrenaline, acetylcholine, histamine, atropine, pilocarpine, thyroxine, tetramethylenediamine, tetrahydronaphthylamine and methylguanidine. In addn. certain bacterial emulsions and amino acids were studied.

F. L. DUNN

The effect of tetronal on the production of hematoporphyrin in the urine. FREDERICK G. GERMUTH. *Indian Med. Gaz.* 64, 491-2(1929).—The general relation existing between sulfonal, trional and tetronal as to their property of accelerating the production of hematoporphyrin in urine is in the proportion, 1.00 sulfonal : 1.34 trional : 1.56 tetronal. Apparently, the production of the porphyrin in urine is considerably influenced by the molecular alkyl structure of the sulfone ingested. F. G. G.

A case of accidental poisoning with barium sulfide. BHUPAL SINGH. *Indian Med. Gaz.* 64, 506-7(1929).—Depilatory powder consisting of 1 part BaS and 8 parts washing earth produced definite symptoms of poisoning. There was complete recovery following administration of $MgSO_4$ soln. FREDERICK G. GERMUTH

The bismuth treatment of carcinoma according to the method of H. Kahn. FRITZ LASCH AND ALFRED NEUMANN. *Klin. Wochschr.* 8, 1021(1929).—The combination of Bi and x-ray therapy may give rise to a temporary improvement, but the outcome of the disease is inevitably fatal. MILTON HANKE

The relation between the liver function and the blood-sugar content. III. The influence of the parenteral administration of the hepatotoxin on the function of carbohydrate metabolism of the liver. MASARU SHINMEN. *Japan. J. Exptl. Med.* 7, 67-85 (1928).—Hepatotoxins, prep'd. by immunizing rabbits with emulsions of rabbit and rat livers, were injected into rabbits and rats. Small doses had no effect on the blood-sugar level, on the degree of hyperglucemia produced by feeding glucose or by injection of adrenaline, or on the glycogen content of the liver. Successive large doses were toxic, and caused a marked loss of wt. A temporary hyperglucemia was produced, and a disturbed carbohydrate metabolism, persisting for several weeks. This was shown by a lowered tolerance to ingested glucose, a lessened degree of adrenaline hyperglucemia, and a marked decrease in the glycogen content of the liver. There was no indication of species specificity. ELEANOR M. HUMPHREYS

Pigmentation of the skin after treatment with irradiated ergosterol. J. BERNHEIM-KARRER AND G. ZARUSKI. *Monatsschr. Kinderheilk.* 42, 24-7(1929).—Irradiated ergosterol was administered to one of a pair of identical twins. Hyperpigmentation of the skin of the treated infant was observed. Comparison of microscopic sections of the skin of the treated and control infant showed a greater amt. of pigment in the basal layer of the epidermis of the former. Apparently, the oral administration of irradiated ergosterol has an effect on skin pigmentation similar to that induced by direct irradiation of the body surfaces. ELEANOR M. HUMPHREYS

A rare aniline poisoning in childhood. KURT OCHSENIUS. *Monatsschr. Kinderheilk.* 43, 54-7(1929).—"Pellidol," an acetyl deriv. of aminoazotoluene, is widely used in dermatological practice as an epithelial stimulant. A 2% salve was applied to the skin of an infant suffering from a severe eczema, with widespread excoriations. Marked cyanosis developed, and methemoglobin was demonstrated in the blood serum. Cyanosis disappeared upon removal of the dressings, and reappeared when the salve was again applied. ELEANOR M. HUMPHREYS

Idiosyncrasy towards irradiated ergosterol. KURT OCHSENIUS. *Monatsschr. Kinderheilk.* 43, 58-9(1929).—Irradiated ergosterol should not be used indiscriminately or in too large doses. Even in healthy infants it may give rise to gastrointestinal disturbances. ELEANOR M. HUMPHREYS

The action of synthetic thyroxine upon persons with thyroid hyperfunction. HANNS BAUR. *Deut. Arch. klin. Med.* 160, 212-32(1928); cf. *C. A.* 22, 3226.—Normal persons given 2 mg. thyroxine subcutaneously on 3 successive days showed a marked increase in the basal metabolic rate (10-30%) (persisted for 5-6 days). There was a slight increase in the pulse rate between the 3rd and 6th days, and slight discomfort. Persons with slight hyperthyroid symptoms, or with fully developed Basedow's disease, or with hyperthyroid function induced by I were not distinguished by their reaction to thyroxine. About $\frac{1}{4}$ of the cases showed an increase in basal metabolism; in $\frac{3}{4}$ the rate was only slightly or irregularly affected. Administration of I as diiodotyrosine or iodostearin caused the usual temporary decrease in metabolic rate. The effect of the thyroxine is not due merely to the I content. The effect of thyroxine or of I can be better judged by the pulse rate and by the general condition of the patient than by measurements of basal metabolism. P. Y. JACKSON

Origin and clinical behavior of acute lead poisoning. J. GELMAN. *Deut. Arch. klin. Med.* 163, 1-13(1929); cf. *C. A.* 22, 3930.—In numerous cases of acute Pb poisoning there was observed a considerable disturbance in pigment metabolism, accompanied by strongly marked hemolytic processes. Up to 4.2 mg. per liter coproporphyrin was excreted in the urine; there was a distinct increase in vital and basophilic granulation of erythrocytes, an increase of urobilin in the urine and of bilirubin in the blood. A

symptomatic and genetic relationship to acute genuine hematorporphyry is noted.

P. Y. JACKSON

Determination of the activity of cocaine-hydrochloride on different nerve trunks. J. REGNIER. *Compt. rend.* 189, 264-6(1929).—See C. A. 23, 4743. A. L.

The pharmacological action of mallein. A. M. PREOBRAZCHENSKŪ. *Z. Immunitts.* 58, 318-34(1928).—Mallein is, pharmacologically, of slight activity. The greatest sensitivity is shown by the cardio-vascular system for which it has a pressor action. JULIAN H. LEWIS

Lead in cancer treatment. SIMONE LABORDE. *Ann. méd.* 23, 411-8(1928).

A. E. MEYER

A pharmacologic and therapeutic research in some cases of diabetes. F. SERIO. *Minerva Med.* 9, 860-6(1929).—Report on the effect on blood sugar in the diabetic of adrenaline, histamine, thyroxine, pituitrin, atropine, ergotamine, pilocarpine, eserine, glukhormont, synthalin and acotin. A. E. MEYER

Studies on tissue respiration. V. The effect of thyroxine, adrenaline and insulin on the oxygen utilization of the surviving diaphragm of the rat. G. PAASCH AND H. REINWEIN. *Biochem. Z.* 211, 468-74(1929).—No effect was noted. S. M.

Clinical and experimental contributions to bismuth intoxication with special reference to stippling of erythrocytes. ERNST DERRA. *Folia Hematol.* 38, 367-78(1929).—Stippling of erythrocytes may occur in Bi poisoning but it is rare. J. T. M.

The phenomenon of oligodynamic action. Salt inhibition. N. LEITNER. *Zentr. Bakt. Parasitenk.*, I Abt., 112, 368-75(1929).—The oligodynamic action of Cu "activated" water was inhibited by NaCl concns. between $M/8$ and $M/32$, but not by higher or lower concns. Chlorides of K, Ca and Al gave similar curves. This cannot be explained by the formation of complex ions. JOHN T. MYERS

The sympathomimetic action of ephedrine. F. R. CURTIS. *J. Pharmacol.* 35, 333-41(1929). CECILIA RIEGEL

Antipyretic action and toxicity of combinations of magnesium with phenylcinchoninic acid. H. G. BARBOUR AND J. E. WINTER. *J. Pharmacol.* 35, 425-34(1929). C. R.

The effect of intravenous injections of colloidal lead upon the circulatory system. WALTER J. DILLING. *J. Pharmacol.* 35, 449-62(1929). CECILIA RIEGEL

Comparative investigations on the elimination of drugs administered intravenously or subcutaneously. LINA STRADA. *Arch. farmacol. sper.* 47, 36-55(1929).—The amts. of sodium hypophosphite and of sodium salicylate excreted by rabbits are approx. the same whether given intravenously or subcutaneously. Less KI is eliminated when given subcutaneously than when given intravenously. G. SCHWOCH

Toxicology of bismuth. II. Distribution of bismuth in the organism after injection of aqueous solutions of different bismuth compounds. R. FABRE AND M. PICON. *J. pharm. chim.* [8], 9, 97-112(1929); cf. C. A. 23, 2215, 3749.—Bi cacodylate (A) in aq. soln. and Bi camphocarbonate in oily soln. proved less toxic than ammoniacal Bi citrate (B) which caused death of the test animals in much weaker doses. In toxic doses, the kidneys are especially affected, and the urea content of the blood is increased. Then there is also an increase of Bi in hairs as eliminating organs. The liver retains a quantity of Bi varying with the rapidity of toxic development. The blood contains more Bi than in nontoxic cases, notably after the last injection before the Bi could become distributed. The brain absorbs more Bi on injection of oily than of aq. solns. A was rapidly eliminated and the quantities of Bi found were not high in any organ; the renal function was not much altered, and the urea content of the blood was not much increased unless a toxic dose was given. A final table summarizes the distribution of Bi in the various organs of the test animals used. S. WALDBOTT

Pharmacology of *Eriocoma floribunda*. G. G. COLIN. *J. Am. Pharm. Assoc.* 18, 876-80(1929).—This drug is not official in the Mexican pharmacopoeia. Weak infusions given to "help" labor often tetanize the uterine muscle. Alkaloids were absent. Partial pptn. with EtOH in an alk. medium, pH 9.5, gave an active fraction. This was sep'd. into an active and an inactive portion by partial soln. in H_2O . Cardiac and respiratory movements and blood pressure are not affected. There is no coagulating effect. The isolated uterus is contracted, the contractions being irregular and lasting 20 to 120 sec. with intervals of 20 sec. In this respect its action resembles pituitrin and ergot. The plant contains a large amt. of inert material so that fixing dosage is difficult. The active agent, which could not be isolated, has been named *ericomine*. L. E. WARREN

The action of non-specific irritants upon capillaries and the white blood picture in tuberculosis. REINHARD BRAUN. *Beitr. klin. Tuberk.* 69, 70-85(1928).—Following the parenteral introduction of min. amts. of non-sp. irritants (Aurophos, Lipatren, Ca

chlorate, nearsphenamine and ether ext. antibodies according to Jessen) no definite change in the capillaries examd. microscopically could be detd. In the majority of cases there was a constriction of the capillary loops a few minutes after the injection; this was the result of a reflex effect upon the vegetative nerve ends. After the use of Aurophos there occurred in the majority of cases an increase in the neutrophils, a diminution of the leucocytes and a shift of the leucocyte picture to the left. Ca called forth an eosinophilia.

H. J. CORPER

N-Phenyl- β -aminopropionamide-4-arsonic acid and related compounds [for trypanosomal infections] (HAMILTON, SIMPSON) 10.

The influence of the thyroid gland and hypophysis upon growth and development of amphibian larvae. BENNET M. ALLEN. *Quart. J. Biol.* 4, 325-52(1929).—A review. J. B. BROWN

Chemical studies on the silkworm-pupa as fish food. I. The difference in chemical constitution of pupa of various sorts. OSHIMA-SHINOBU. *J. Imp. Fisheries Inst.* 23, 114-5(1929).—About 38 million kg. of dried silkworm-pupa is produced in Japan, most of which is used for fish food. It contains on the dry basis about 4.3% ash, 31% ether ext., 8.8% total N, 1% non-protein N. The protein of the Spring silkworm-pupa contains 14.82% total N, 1.05% amide N, 0.27% melanin N, 9.64% monoamino N, 3.85% diamino N, 0.87% histidine N, 1.05% lysine N, 1.88% arginine N and 0.05% cystine N. Among the sorts analyzed there were no large differences in proximate compn. or in N distribution. II. The digestion of silkworm-pupa with protease of eels. *Ibid* 115 6.—The protease of eels is most active between pH 5.7 and 7.4 at 33.5° to 36°. III. A chemical change of stored pupae. *Ibid* 117.—Wet pupae decompose in a few days. Dried pupae decompose slowly, the acid value of extd. oil increasing from 24.43 to 71.58 in a yr. D. B. DILL

The seasonal change of the chemical constitution of muscle of carps. OSHIMA-SHINOBU. *J. Imp. Fisheries Inst.* 23, 118-9(1929).—Carp in August contained 21.80% total solids, 1.21% crude ash, 2.30% ether ext. and 2.96% total N. Seasonal variations were not large. D. B. DILL

The chemical change of the eels in the course of fasting. OSHIMA-SHINOBU. *J. Imp. Fisheries Inst.* 23, 119-20(1929).—In 50 days' fast in water ranging from 8° to 18° total solids decreased from 42 to 40% and ether ext. from 24 to 21%. Loss of body wt. was about 11%. D. B. DILL

Glucolysis in the fertilized and non-fertilized eggs of sea urchins. RIVKA ASHBEL. *Boll. soc. ital. biol. sper.* 4, 492-3(1929).—After fecundation the eggs of sea urchin show a definite increase in anaerobic glucolysis. PETER MASUCCI

Blood-sugar studies on selachians. BRUNO KIRSCH. *Biochem. Z.* 211, 276-91 (1929).—It is considered that the normal blood-sugar level of these fish is about 20-40 mg. %, and this does not seem to depend upon the degree of filling of the gastrointestinal tract. In hepatectomized animals the blood-sugar level falls markedly in a few days, to 5-10 mg. %, the fall in sugar being much more rapid if the temp. is raised. Asphyxia causes hyperglucemia which at 15° appears in about an hr. and at higher temp. more quickly. Upon return to oxygenated water the blood-sugar level still continues to rise for a while and only very slowly comes back to the normal level. The extra sugar in the asphyxiated animals comes from the liver and does not occur in hepatectomized fish. Adrenaline causes marked asphyxia so that the rise and fall in blood sugar during asphyxia are associated with the response of the autonomic nervous system. S. MORGULIS

The content of reducing substances in the blood of some invertebrates. BRUNO KIRSCH. *Biochem. Z.* 211, 292-4(1929).—The blood of *Aplysia* shows only traces of reducing substance. In *Sipunculus*, *Carcinus* and *Eriphia* quantities are found similar to those noted in frogs or in sea fish. S. MORGULIS

Some physico-chemical phenomena during regeneration. III. Buffering of the tissues of the regenerating Axolotl limb. N. OKUNEV. *Biochem. Z.* 212, 1-15 (1929); cf. *C. A.* 23, 4274.—The tissue buffering of the regenerating Axolotl limb is definitely increased during the first 8 weeks of regeneration, and in addn. to the normally occurring buffering max. between pH 6 and 7, a second max. is observed also between pH 5 and 6. The tissue acidity in the first few days of regeneration is accompanied by a rise in buffer value which reaches its max. between the 5th and 8th regeneration day, at the time of a new rise in the tissue acidity, and then returns to normal. This

increase in buffering may either be due to an accumulation of acid cell decompn. products or to an increased adsorption of the tissues. S. MORGULIS

Influence of the ovary of normal and of laying hens on the growth and metamorphosis of frog tadpoles. GAETANO MOSCHINI. *Endokrinologie* 3, 29-32(1929).—Growth and metamorphosis of frog tadpoles are accelerated if fed on beef heart to which hen ovary had been added, either from normal or from laying hens, as compared to tadpoles fed on beef heart alone. Likewise tadpoles fed on meat from laying hens grow and metamorphose quicker than such fed meat from non-laying hens. S. M.

12—FOODS

F. C. BLANCK AND H. A. LEPPER

Food colors. L. WHINYATES. *Chemicals* 32, No. 11, 10-11(1929).—See C. A. 23, 3988. E. G. R. ARDAGH

Radium content of some foodstuffs. E. S. BURKSER, M. YA. SHAPIRO AND K. G. BRONSTEIN. *Biochem. Z.* 211, 323-5(1929).—With the exception of the ash from potatoes, a no. of foodstuffs studied showed a Ra content of 0.5 to 9.6×10^{-12} g. per g. of ash. S. MORGULIS

The damage to bread cereals by germination. Behavior of germinated meal in the baking process. M. P. NEUMANN, A. MÜHLHAUS AND H. KALNING. *Z. ges. Getriedewesen* 15, 24-35, 49-61; *Chem. Zentr.* 1928, II, 299.—The degree of germination of grains stored under moist conditions was estd. The rise in moisture content, decrease in carbohydrates, and change in protein and mineral form are characteristic. The condition of the meal or grain may best be estd. by detg. the diastatic power of the enzymes present by the method of Lintner. Germination up to 3% does not seriously impair quality but 5-10% seriously lessens the value of the meal or grain. In fermentation it is best to use a young but very active yeast. FRANCIS P. GRIFFITHS

Wheat and flour. FRANK T. SHUTT. Canada Dept. Agr., *Rept. Dominion Chemist, Year Ending March 31, 1928* 44-50(1929); cf. C. A. 23, 445.—Tables are given showing the protein, ash and H₂O content and av. wt. per 1000 kernels of the Marquis, Garnet and Reward varieties of wheat grown under various conditions in Alberta, Manitoba and Saskatchewan. In general, the Reward variety had the highest protein content and the Garnet variety the lowest. During the last 12 days of the ripening period there was a steady increase in the protein content of Marquis wheat. The bleaching agent Agene had no effect on either the amt. or character of the gluten in Marquis and Garnet flours, but treatment with Novaldelox B resulted in somewhat lower percentages of wet and dry gluten. K. D. JACOB

The colorimetric differentiation of rye and wheat flours and their mixtures. E. BERLINER AND J. KOOPMANN. *Z. ges. Mühlenwesen* 5, 42-5; *Chem. Zentr.* 1928, II, 501.—Wheat flour is dyed violet by concd. HCl while rye flour becomes red-brown. Mixts. give mixed colors. The violet color is due to a tryptophan reaction of the protein. Details of the test are given. C. R. FELLERS

Educational aspects of dairy and milk inspection. C. L. ROADHOUSE, et al. *Am. J. Pub. Health* 19, 1129-32(1929).—Rept. of the comm. of Internatl. Assoc. of Dairy and Milk Inspectors, 1928. J. A. KENNEDY

Metals for dairy machinery. Report to dairy research committee. F. H. McDOWALL. *New Zealand J. Sci. Tech.* 11, 14-25(1929).—Tinned Cu is used most for dairy app. As the Sn wears, Cu is in contact with milk or cream. Cu alloys like monel and silveroid are not substitutes for tinned Cu. Al is suitable for vats and tubes only if pure. Fabricated Al is better than cast. Al is too soft for cheese vats or milk cans, but expts. are being made with Al-Mn alloys. Al app. must not be cleaned with NaOH or Na₂CO₃, but by a Na₂CO₃-Na₂SiO₃ mixt. Ni can be used for milk app. It dissolves to some extent but does not affect taste. Experience with stainless steels has been variable, because of difference in manuf. Cr-Ni steels are satisfactory in all respects. E. M. SYMMES

Metals and their various influences on milk. OTTO F. HUNZIKER. *Proc. 8th World's Dairy Congress* 1928, 136-51.—See C. A. 23, 2506. A. PAPINEAU-COUTURE

Copper in dairy products and its solution under various conditions. II. J. MISCALL, G. W. CAVANAUGH AND P. P. CARODEMOS. *J. Dairy Sci.* 12, 379-84(1929).—A continuation of the investigation by Rice and Miscall (C. A. 17, 3211). The dissolving power of milk increases directly up to 140° to 145°F. and then decreases. It decreases by either removing the milk gases or adding CO₂. The presence of O increases the amt.

of Cu which goes into soln. but does not change the general type of the soly. curve as obtained in the other expts. Pasteurized milk dissolves more Cu than raw milk at the same temp. Conclusion: Some reaction takes place in the milk serum, when milk is heated for 2 hrs. in contact with bright Cu, above the temp. of pasteurization, which decreases the Cu-dissolving power of milk.

J. C. JURRIJENS

Bacteria that survive and grow during the pasteurization of milk and their relation to bacterial counts. PAUL S. PRICKETT AND ROBERT S. BREED. N. Y. State Agr. Expt. Sta., *Bull.* No. 571, 25 pp. (1929).

Methods of testing the cleanliness of milk in Germany. C. F. VAN OIJEN. *Proc. 8th World's Dairy Congress 1928*, 697-710.—A description of the principal phys., biochem., microscopical and bacteriological methods for testing the cleanliness of milk.

A. PAPINEAU-COUTURE

The judgment of milk from the hygienic point of view, with special reference to conditions in Denmark. S. ORLA-JENSEN. *Proc. 8th World's Dairy Congress 1928*, 656-60.—From a brief discussion of the problem, it is considered that the fermentation-reductase test should be combined with judgment by taste and smell in judging the quality of milk.

A. PAPINEAU-COUTURE

Control of the sanitary quality of market milk. ROBERT S. BREED. *Proc. 8th World's Dairy Congress 1928*, 666-70.—A brief outline of lab. methods used in North America for controlling the quality of milk: agar plate technic, methylene blue reduction method, direct microscopic examn.

A. PAPINEAU-COUTURE

Modern methods of laboratory control for milk supply. MOHR. *Proc. 8th World's Dairy Congress 1928*, 673-89.—A description of the control of the quality of milk supply, as exemplified by the tests in use at Meierei C. Bolle A. G., Berlin, and the School Dairy of the Prussian Dairy Exptl. and Research Inst., Kiel, the methods being described and interpretation of the results discussed.

A. PAPINEAU-COUTURE

The freezing point of milk. J. D. FILIPPO. *Proc. 8th World's Dairy Congress 1928*, 723-5.—Detn. of the f. p. of milk has been used for the last 20 yrs. in Holland for the detection of added water in milk, a f. p. higher than -0.53° being considered evidence of watering. Of thousands of milks of known purity there was found but one with an abnormal f. p., viz., -0.48° to -0.51° , in a herd of 20 cows belonging to 1 farmer; in this case the feed of the cows had been insufficient for several months, and contained a large quantity of water. The precautions which should be taken in carrying out the detn. are briefly outlined.

A. PAPINEAU-COUTURE

The freezing point of milk as a means of detecting added water. J. H. BUCHANAN AND O. E. LOWMAN. *Proc. 8th World's Dairy Congress 1928*, 725-33.—In general the depression of the f. p. of milk, as suggested by Hortvet, is a satisfactory method for detecting added water. H_2O contg. either electrolytes or nonelectrolytes may be added in appreciable quantities without the depression of the f. p. being affected by these substances. There is a variation in depression of the f. p. depending on the season, high values being found in April and May and low values in Dec. and Jan.

A. P.-C.

The effect of heat on milk. (A) The coagulability by rennet. (B) The nitrogen, phosphorus and calcium content. ELFREDA C. V. MATTICK AND HOWARD S. HALLETT. *J. Agr. Sci.* 19, 452-62 (1929).—Milk which has been heated to temps. varying from 105° to $209^{\circ}F.$ for $\frac{1}{2}$ hr. differs from raw milk in its reaction to rennet in all cases. There is a pronounced "slowing down" in coagulation, becoming more marked with the higher temps. There is no change in the diffusibility of the nitrogenous substances, after heating to 105 – $209^{\circ}F.$ for $\frac{1}{2}$ hr. Heating to $175^{\circ}F.$ and above for $\frac{1}{2}$ hr. appears to reduce the diffusibility of the P content. Heating to $125^{\circ}F.$ and above for $\frac{1}{2}$ hr. causes marked diminution in the Ca content.

P. R. DAWSON

A study of the apparent viscosity of milk as influenced by some physical factors. GEORGE M. BATERMAN AND PAUL F. SHARP. *J. Agr. Research* 36, 647-74 (1928).—The viscosity coeff. of whole milk, condensed skim milk and even skim milk is not independent of the rate of shear but decreases as the rate of shear is increased, approaching a const. value at high rates of shear. Mech. agitation produces no decrease in the viscosity of skim milk or of homogenized milk but it may cause a decrease in the viscosity of milk contg. clumps of fat globules on account of the breaking up of the clumps. The viscosity of skim milk increases with age. Homogenization causes a distinct rise in the viscosity of whole milk but produces no change in the viscosity of skim milk. Pasteurization of skim milk at 62° for 30 min. causes a slight increase in viscosity when detd. at 25° , and maintaining skim milk in a frozen condition for 1 day has a similar effect. The viscosity values obtained after dilg. skim milk with various amts. of water fall on a slight curve

showing that the viscosity is not strictly a linear function of the total solids. The expts. indicate that the viscosity of a sample of milk does not accurately indicate the total solids content except possibly for very restricted groups of samples. W. H. ROSS

Factors affecting the yield and quality of milk. I. The age of the cow. R. R. KAY AND ANDREW C. M'CANDLISH. *J. Agr. Sci.* 19, 342-72(1929). The variations in production due to age were investigated with the records of 738 Ayrshire cows for 4380 lactations. Milk and butterfat production increase up to about 7 yrs. of age and then decrease. The fat % is higher for 3-yr. olds than for older cows. After 3 yrs. there is little change in the fat % with age that is of practical significance until advanced ages are reached, when there may be an important drop. The tendency for milk to show a slightly lower fat % as the cow advances in age is probably due to the fact that as the milk yield changes the fat yield changes in the same direction but at a slower rate. Heifers with a low fat % need not, as a rule, be expected to test higher on reaching maturity. P. R. DAWSON

The influence of feeding on the composition of milk. Mangels versus dried sugar beet pulp. HAROLD T. CRANFIELD. *J. Agr. Sci.* 19, 302-10(1929).—Expts. were carried out with 2 groups of cows at each of 2 centers in Leicestershire during the spring of 1928, to compare the values of mangels and dried sugar beet pulp in the winter ration of dairy cows. Composite samples of the milk from each group of cows were taken at 6 consecutive milkings per week during the period of the expt. Detns. of fat and solids-not-fat were made, and the yield of milk at each milking was recorded. Although there are indications that the change of ration caused a slight temporary variation in the quality of the milk, the secretion of milk solids followed, generally, the variation in yield. This is confirmed by the av. compn. figures representing the whole of the milk from each particular ration. P. R. DAWSON

Variation in the composition of the milk of an abnormal cow. H. T. CRANFIELD AND E. R. LING. *J. Agr. Sci.* 19, 491-9(1929).—Studies were made of the compn. of the milk during a period covering 3 lactations of an abnormal cow, subsequently found to be suffering from tuberculosis of the udder. The percentages of fat were very variable but the solids-not-fat were consistently low, only 2% of the total no. of samples exceeding 8.5%. Protein and lactose were much below the av. for normal milk. With total ash the figures were normal. Of the ash constituents, the insol. portion was low and the sol. portion very high, indicating a high Cl content. The percentages of P_2O_5 and CaO were considerably below the av. for normal milk. The lactose and sol. ash percentages showed a marked neg. correlation, supporting the contention that a definite lactose-Cl ratio exists in milk. It is suggested that an abnormally low solids-not-fat content and abnormal percentages of the individual ash constituents may be a sign of incipient disease affecting the milk-secreting organs. P. R. DAWSON

A practical method for fat determination in milk. BALWANT SINGH. *J. Central Bureau Animal Husbandry & Dairying India* 2, 178-9(1929).—To 11 cc. of milk contained in a Gerber tube, add 5 cc. Fehling soln. (50-55 g. NaOH, depending on quality, and 173 g. Rochelle salt in 500 cc. H_2O) and 1 cc. of a mixt. of 55 parts isobutyl alc. and 45 parts MeOH. Invert the tube, shake gently, and immerse in a water bath at 80° until the color of the liquid becomes deep orange (about 3 min.). Remove the tube, shake as before and heat 3 min. longer. Add 5 cc. of hot water, disturbing the fat layer as little as possible, and invert the tightly corked tube in the water bath for a short time until the column of fat becomes distinct and easily readable. The method is rapid and accurate and requires no particular skill for its operation. Figures comparing results by this and other methods are not given. K. D. JACOB

The direct and indirect determination of the energy power of milk in relation to the nutritive needs of the child. ELIA SAVINI AND ORESTE GARZIA. *Proc. 8th World's Dairy Congress* 1928, 543-8.—Many samples of milk were analyzed for fat, protein and lactose, and the calorific values were calcd. from these results by means of various formulas and were also detd. directly in a Mahler bomb calorimeter. Indirect detn. by means of formulas based on the fat content is eminently suitable for estg. the nutritive requirement of the child, as the values thus obtained do not differ from that detd. directly by more than $\pm 20-30$ cal. for collected milks of normal compn., by more than ± 60 cal. in milks contg. 4-4.5% fat, and by more than 100 cal. in cases of exceptional fat content (above 4.7%), and also because the calorific value is obtained more rapidly and with less chance of error by the indirect than by the direct method. Among the formulas studied, the following modification of Andersen's formula gave the most approx. correct results: $C = 280 + 113.5 \times G$, in which C is the calorific value of 1 kg. of milk and G the % fat. The use of the calorific power of milk, found indirectly, greatly facilitates the prepn. of a milk of known energy power, even for market milks. A. PAPINEAU-COUTURE

The solubility of calcium phosphate in fresh milk. E. O. WHITTIER. *J. Dairy Sci.* 12, 405-9(1929).—A calcn. has been made of the Ca-ion concn. of normal fresh milk, based on recent exptl. results bearing on the mutual effects of H, Ca, P and citrate ions on one another. A calcn. of the ion product $[Ca^{++}] \times [HPO_4^{--}]$ in normal fresh milk gives a value less than that of the corresponding soly. product. Exptl. evidence as to the validity of the method of calcn. is offered in the form of an expt. in which the pptn. of Ca phosphate was prevented by the presence of citrate. Conclusion: The soly. of Ca phosphate in milk is affected by the amt. of citrates present and this effect is probably specific. J. C. JURRJEHS

The ash and non-fatty solids content, the specific gravity and the determination of the refractive index of the calcium chloride serum in individual samples of milk. L. BÉM. *Proc. 8th World's Dairy Congress 1928*, 767-8.—The n of the CaCl₂ serum of the milk was detd. 3 hrs. after milking, and again 12-18 hrs. later; at the time of the 1st n detns., the sp. gr. of the milk and of the serum, total solids, fat and ash were also detd. No strict rule was found relating the n to the other figures. On the 72 samples examd., there was an av. increase of 0.5° (Zeiss immersion refractometer) in the n after 12-18 hrs., in 6 cases the increase was 1.05-2.45° and in 14 it was 0.55-0.9°. With very few exceptions the ash of the morning milk was greater than that of the evening or that of the midday milk, while the sp. gr., n and solids-not-fat were smaller in the morning milk.

A. PAPINEAU-COUTURE

Appreciation of the refractometer test. JOHN HANLEY. *Proc. 8th World's Dairy Congress 1928*, 744-67.—An extensive discussion of the value of the refraction of the milk serum for detecting added water. H. agrees with Tocher that the f. p. of milk is its most const. property and that the n is 2nd in this respect. A. PAPINEAU-COUTURE

The value of the refractometer in milk analysis. G. D. ELDON AND J. R. STUBBS. *Proc. 8th World's Dairy Congress 1928*, 740-3; cf. C. A. 22, 1632.—From a consideration of the literature and from their own examn. of over 7000 samples of mixed milks, E. and S. think that the refractometric test for the detection of added water offers no advantage over the detn. of the solids-not-fat. In one respect it is definitely inferior, since as decompn. proceeds the amt. of solids-not-fat found is always lower than that for the fresh milk, while the refraction figure first rises above that of the fresh milk and then falls below it. The test therefore is of value only when the milk is fresh. E. and S. cannot accept the statement that a milk naturally deficient in solids-not-fat gives a normal refraction, as such samples are entirely outside their experience and are quite at variance with the general conclusions to which exptl. data point. A. P.-C.

Study of the use of the methylene-blue (reductase) test in the grading of milk. M. GRIMES. *Proc. 8th World's Dairy Congress 1928*, 713-6; cf. C. A. 22, 120.—Results are compared of the reductase test (using 40 cc. of milk) and bacterial counts (incubating either 48 hrs. at 37° or 120 hrs. at 20°) on 867 samples of milk that had not been cooled or treated in any way and most of which were examd. 3-8 hrs. after milking. The test was found unreliable for the grading of milk with low bacterial count. Where milk is cooled and held at low temps. for over 24 hrs and the reductase time compared with the total bacterial count, the latter will often be markedly in excess of the max. bacterial count given in the various grades. The test is of greatest value in grading milk supplies when combined with the fermentation test.

A. PAPINEAU-COUTURE

Comparison of the bromothymol blue milk test and the methylene blue reaction test for determining quality of milk. F. D. DEVEREUX. *J. Dairy Sci.* 12, 367-73 (1929).—The bromothymol blue test fulfils its purpose, grading milk fairly accurately into a large no. of classes according to keeping quality, when av. scores were studied. The reduction test fluctuated more, but was able to grade milk into 4 classes with equal accuracy. The correlation coeffs. between each test and the keeping quality were both found to be +0.77.

J. C. JURRJEHS

Progress in the irradiation (of milk) by ultra-violet light. A. SALMONY. *Chimie & Industrie* 22, 259-60(1929).—The 2 chief difficulties preventing the irradiation of milk are the production of O₂ and the heating of the milk. These have been overcome by operating in an atm. of CO₂ and providing a suitable cooling element. A commercial app. (briefly described) has been constructed and is operating successfully. A. P.-C.

Some of the physical and chemical properties of powdered milk. A. MIYAWAKI. *Proc. 8th World's Dairy Congress 1928*, 370-6.—A summary of the studies on the subject made at the Hokkaido Imperial Univ., Japan. A. PAPINEAU-COUTURE

The action of viscogen (calcium saccharate) on milk and cream. G. T. PYNNE. *J. Agr. Sci.* 19, 463-71(1929).—Investigations showed that the primary reaction appears to be the formation of a ppt. of insol. (tri-Ca) phosphate. Considerable quantities of casein are carried down by the ppt., and this co-pptn. of casein is probably the single

factor which most influences the viscosity. Casein is not directly pptd. by viscogen, but the viscosity of its solns. is slightly increased as a result of their higher alkyl, on account of this reagent. This action of viscogen is relatively unimportant in influencing the viscosity of milk or cream. P. R. DAWSON

Some factors influencing viscosity in cream. G. T. PYNE and J. LYONS. *Proc. 8th World's Dairy Congress 1928*, 184-8; cf. *C. A. 22*, 2999.—Pasteurization reduces considerably the viscosity of cream. This can be restored in a large measure by quickly chilling the pasteurized cream and almost immediately re-sepg. at a low temp. (50°F.). A considerable amt. of fat passes away in the "skim" milk from the re-sepn., but can be returned to the new milk or cream vats and need not occasion any loss. Gradual addn. of lactic acid to pasteurized cream produced marked increases in viscosity in rich cream (50% fat) at lower serum acidities than with poorer creams, the increase becoming noticeable at a p_H value varying from about 5.8 to 5.0 according to the richness of the cream and the method of adding the acid. When the acidity is developed by inoculation with a culture of *Streptococcus lactis* the "critical acidity" of the serum is the same for both rich and poor creams, has a higher value than that found by direct addn. of lactic acid and occurs fairly sharply around p_H 4.8-4.9. Examn. of the dild. creams showed visible flocculation in all cases where viscosity was greatly increased, irrespective of the exact degree of acidity at which it took place. A. PAPINEAU-COUTURE

The lipolysis of worked butter, several days after preparation. OTTO GRATZ. *Proc. 8th World's Dairy Congress 1928*, 456-60.—Lipolysis was not appreciably influenced during the 1st 14 days through the mixing of the outer with the inner part, but after that considerably greater lipolysis took place in the butter which had been reworked without removal of the outer layer; but the length of time that elapsed between the making of the butter and the re-working had no particular influence on the degree of lipolysis that took place. The expts. were carried out at room temp., while in com. practice it is generally stored at about 1-2°; similar conditions probably would have been found if the butter had been subjected to low-temp. tests, but would have taken longer to develop. A. PAPINEAU-COUTURE

Adulteration of butter and ghee with animal fat and vegetable ghee and its detection. PHANIBHUSAN SANYAL. *Mem. Dept. Agr. India, Chem. Ser.* 10, 143-55(1929); cf. HARRISON, *C. A.* 23, 4519. K. D. JACOB

A study of lactose-fermenting yeasts isolated from milk, cream and butter. M. GRIMES and J. DOHERTY. *Sci. Proc. Roy. Dublin Soc.* 19, 261-4(1929). E. J. C.

The microbial flora of belpaese (cheese). G. DALLA TORRE. *Proc. 8th World's Dairy Congress 1928*, 462-3.—Fresh belpaese (Galbani) contained lactic acid bacteria, particularly *Streptococcus lactis* in large numbers, together with smaller numbers of lacto bacilli (the thermobacterium and streptobacterium of Jensen) and also yeasts and bacteria of the coli-aerogenes groups to a less extent. The microflora of the ripe cheese does not vary greatly from that of the raw curd. A. PAPINEAU-COUTURE

A color defect of process cheese. WALTER V. PRICE. *J. Dairy Sci.* 12, 377-8 (1929).—The normal color usually darkened during the last stages of the heating process. It was found to be due to an accumulation of residual cheese caused by the stopping of the process during the noon hour recess. Cleaning the kettles after each batch made removed the defect. J. C. JURRJENS

The casein-splitting properties of starters. C. BARTHEL and W. SADLER. *Proc. 8th World's Dairy Congress 1928*, 654-6; cf. *C. A.* 23, 1695.—Cultures of isolated lactic acid bacteria of the *Streptococcus* group often produce the same amt. of "sol. N" from casein as do the starters, but the amt. of amino N produced in the pure cultures is far below the amt. of amino N produced by the mixed cultures in the form of starters. The importance of the casein-splitting properties of the lactic acid bacteria of the *Streptococcus* group, with respect to the explanation of the process of cheese ripening, is emphasized by the fact that ordinary starters as used in the manuf. of cheese possess the power of forming large quantities of amino acids from casein. A. PAPINEAU-COUTURE

Relation of temperature of fermentation to quality of sauerkraut. E. A. MARTIN, W. H. PETERSON, E. B. FRED and W. E. VAUGHN. *J. Agr. Research* 39, 285-92(1929).—The quality of sauerkraut depends very largely upon the temp. at which fermentation is carried out, the most favorable temp. for fermentation being between 60° and 65°F. High temps. favor the production of soft and pink sauerkraut. A rise or 3° to 5°F. occurs during the first 8 days in fermentation vats kept at temps. above that of the surrounding air. This rise in temp. is coincident with the greatest activity of the bacteria and is believed to be due to bacterial action. W. H. ROSS

The respiration factor in the deterioration of fresh vegetables at room temperature. MARJORIE P. BENOY. *J. Agr. Research* 39, 75-80(1929).—Numerous green vegetables

of edible maturity were subjected to comparative examn. during the first 30 hrs. after they were harvested. Their changing rates of respiration at 30° were measured and plotted, the total amt. of CO_2 evolved between the 2nd and the 26th hrs. was calcd., and the wts. of glucose presumably oxidized in producing this quantity of CO_2 were computed. With respect to the amt. of gas evolved for equal wts. of dry matter during the 24-hr. period, the vegetables stand in the following descending order: asparagus, lettuce, green bean, okra, green onion, carrot, tomato, beet and green mango. The amts. of glucose accounted for vary from 13.682 g. per 100 g. of dry wt. in 24 hrs. for asparagus to 1.962 g. for green mango. W. H. ROSS

Limes and wither-tip. R. O. WILLIAMS. *Trop. Agr.* (Trinidad) 6, 187-91(1929).—Chem. data are given relating to new varieties of limes. The fruit of a variety found to be resistant to wither-tip disease contained 5.2% citric acid. The expressed oil contained less than half the normal amt. of citral. The sp. gr. and refractive index were also below the lower limit of normal oils. A. L. MEHRING

Composition of commercial acid lead arsenate and its relation to arsenical injury. H. S. SWINGLE. *J. Agr. Research* 39, 393-401(1929).—At low concns. of equiv. As content H_2AsO_3 and H_2AsO_4 are equally toxic to peach foliage but at higher concns. the latter is the more toxic. Arsenic acts as a cumulative poison within peach leaves. The min. concn. of H_2AsO_4 toxic to peach foliage contains the equiv. of 0.0012% of As_2O_3 . Acid lead arsenates contg. less than 0.25% of As_2O_3 in water-sol. form give min. foliage injury and there is, therefore, no advantage in making further reductions in sol. As. PbHAsO_4 cannot be safely used upon susceptible plants without the addn. of some material to prevent burning. The initial sol. As, within ordinary limits, has little or no effect upon the toxicity of PbHAsO_4 to insects. W. H. ROSS

Sulfur-spray residues and the swelling of tin cans packed with peaches. C. W. CULPEPPER AND H. H. MOON. *J. Agr. Research* 39, 31-40(1929).—S-spray residues on the surface of peaches used in canning cause the formation of H_2S and H with the subsequent swelling of the can. Almost all forms of S in the acid juices of the peach lead to the same result. The S has also a corroding effect on the can and seems to act as a catalytic agent in greatly accelerating the action of the fruit acids upon the metal of the container. Certain forms of S corrode the can even when no org. acids are present, but no swelling occurs in the absence of these acids. In ordinary canning the acid juices of the peach act as an electrolyte in which Fe is cathodic to Sn when they are in contact, but if H_2S is present the ferric salts are reduced to the ferrous form and Fe may become anodic to Sn. This relationship, together with the fact that H_2S accelerates the liberation of H from Fe, seems to account for the swelling of cans packed with peaches. S-spray residues may be effectively removed from the surface of peaches by dipping the fruit in hot dil. lye for a few sec. and then washing the fruit with jets of cold water. W. H. R.

Occurrence of the tetanus bacillus in canned peas. F. MARSH AND J. HENDERSON. *Analyst* 54, 536-7(1929).—Many cans of peas imported from Persia during the hot season were "blown" and the contents had a putrid odor. The cans were attacked to a considerable extent and contained gases which were essentially CO_2 and N_2 in approx. equal parts. Bacteriol. examn. showed the presence of *B. subtilis*, *B. mycoides* and *B. tetani*. W. T. H.

Studies on chestnut molds. F. BERTOTTI. *Boll. lab. sper. fitopatol.* (Turin) 6, No. 3, 6-8(1929).—Dusting treatments with Na benzoate, Fe sulfate and salicylic acid are useless with *Penicillium crustaceum*. In this case treatments of the molded chestnuts with didd. HCl or H_2SO_4 without subsequent drying are necessary. G. A. BRAVO

Forage crops. FRANK T. SHUTT. Canada Dept. Agr., *Rept. Dominion Chemist, Year Ending March 31, 1928*, 59-67(1929).—Tables are given showing the chem. compn. of grasses and clovers from Nova Scotia, and hays from the dyked lands of Nova Scotia and New Brunswick and 20 varieties of western prairie forage plants cut at various stages of growth. The high content of protein and ash and low content of fiber in a sample of Russian thistle (*Salsola pestifer*), cut at the early flowering stage, indicated that this plant may prove to be of considerable value for stock feeding. K. D. JACOB

Feeding stuffs. FRANK T. SHUTT. Canada Dept. Agr., *Rept. Dominion Chemists, Year Ending March 31, 1928*, 71-8(1929).—Tables are given showing the compn. of com. and miscellaneous feeding stuffs from Canadian sources. K. D. JACOB

Nutritive value of pasture. IV. The influence of the intensity of grazing on the yield, composition and nutritive value of pasture herbage. II. H. E. WOODMAN, D. B. NORMAN AND J. W. BEE. *J. Agr. Sci.* 19, 236-65(1929); cf. C. A. 22, 2219.—As compared with grass grown under a system of weekly and 2-weekly cuttings, grass cut every 3 weeks showed a slight lowering of the % of crude protein and a slight increase in the % of crude fiber and N-free extractives. There was little difference in the ether ext.,

SiO₂-free ash, Ca and P₂O₅. The main results relating to seasonal variations in the chem. compn. of the 3-weekly pasture cuts were in harmony with those obtained in the 1925 and 1927 investigations. The depressing effect of drought on the crude protein content of grass appears to be more pronounced with weekly cuttings than with 3-weekly. The different intervals of cutting had little effect on digestibility of the grass. At the end of a 3-weeks' period of growth pasture grass still retains the non-lignified highly digestible character possessed at the end of 1 or 2 weeks; and, while slightly less rich in digestible protein, is equal in respect to total digestible org. matter and starch equiv. Cutting at fortnightly intervals produced 29.3% more dry matter over the whole season than did weekly cuttings; the yield from 3-weekly cuttings was 62.3% greater than that from weekly and 25.5% greater than that from 2-weekly cuttings. P. R. DAWSON

Studies of the composition, digestibility and feeding value of linseed cake and extracted linseed meal. F. HONCAMP, P. MALKOMESIUŠ AND A. PETERMANN. *Z. Tierzucht. Zuchtungsbiol. Tierernähr.* 15, 277-88(1929).—In feedings trials with dairy cows linseed cake and extd. linseed meal proved of substantially equal value as detd. by the quantity and fat content of the milk produced. The 2 products were included in rations which were kept identical as regards intake of digestible protein and starch value per 1000 kg. live weight. The 2 products were substantially alike as regards digestibility. L. A. MAYNARD

Grain losses in feeding corn silage to dairy cows. R. B. BECKER AND WILLIS D. GALLUP. *J. Agr. Research* 39, 223-7(1929).—Corn kernels lose protein, crude fiber and ash in the silo but gain in percentages of N-free ext. and ether ext. When dairy cows were fed silage made from dent corn in the glazed stage of maturity, 8.47% by wt. of the grain in the silage was voided in the manure and only 4.36% by wt. of the whole kernels in the silage was recovered as whole kernels from the manure. Analyses showed slight losses of protein, ether ext. and ash from the corn grain in silage which passed through the cow's digestive tract. The corn grain voided in the manure was calcd. to contain 5.22% of the digestible crude protein and 5.26% of the total digestible nutrients in the corn silage. The loss of whole corn in silage fed to dairy cows is decidedly less than that which occurs when cattle consume shelled corn. W. H. ROSS

Pb in red glaze [of culinary ware] (GRONOVER, WOHLNICH) 19. Particle size and the properties of matter [in manufacture of baking powder] (NEVILLE) 2. Endemic goiter and its relation to I content of food (HAYNE) 11G. The mean and variability as affected by continuous selection for composition in corn (WINTER) 11D. Denatured raw sugar as fodder (KRAUS) 28. The individuality of the mammary glands of the cow (PROKS) 11F. The tomato stalk and its value as a fodder (GUARNIERI) 11D. The relation between some constituents of fruit juice and the keeping quality of the fruit at low temperature (LEONCINI, LEVI) 11D. Quantitative examination of the Kreis rancidity reaction (PRITZKER, JUNGKUNZ) 27. Saponification value of fats (TAUFEL, RUSCH) 27. Animal feeding and brewery by-products (HEIGHAM) 16. The chemistry of pectins from fruit (EHRlich, KOSMAHL) 10. Apparatus for sterilizing milk or other liquids by electric treatment (U. S. pat. 1,730,016) 1.

Frozen egg-yolk material. ALBERT K. EPSTEIN (to Emulsol Corp.). U. S. 1,730,879, Oct. 8. An edible salt such as NaCl, Na₂HPO₄ or other substantially neutral edible salt is added to egg yolk (2-8% of NaCl being suitable) and the mixt. after freezing and thawing has a viscosity greater than that of the untreated, unfrozen yolk and a mobility greater than that of untreated yolks when thawed after freezing.

Preserving fresh fruit. SAMUEL E. OLIVER. U. S. 1,729,893, Oct. 1. The temp. of fruit is reduced to about 1° and the temp. of sugar is reduced to about -1° and the fruit and sugar are then packed in a container in such a manner as to isolate the individual fruit from each other and from the container walls, while the temp. is maintained, and the container is then sealed.

13—GENERAL INDUSTRIAL CHEMISTRY

HARLAN S. MINER

The Battelle Memorial Institute. H. W. GILLET. *Mining Met.* 10, 472-4(1929).

The Leipzig Autumn Fair. HEINRICH WIESENTHAL. *Chem.-Ztg.* 53, 691-2 (1929).—The products of "Frigidaire," "Kelvinator," and titanium white are singled out as worthy of special notice. E. J. C. W. C. BRAUGH

The use of power in chemical industries. C. M. A. STINE. *Chem. Age* (London) 21, 237; *Natl. Eng.* 33, 273-4(1929).—"The chem. engineer must have an increasing part in the efficient utilization of the resources of fuels. He is interested in the methods of production of the power as well as in the ultimate costs of the finished power."

W. H. BOYNTON
Acid-resisting products for chemical plant. REX FURNACE. *Chem. Age* (London) 21, 190-3(1929).—The wide range of acid-resisting materials available to chem. engineering today, due to the advance in metallurgy, is reviewed.
E. M. SYMMES

Manipulation in intensive drying. HERBERT B. BAKER. *J. Chem. Soc.* 1929, 1661-4.—The kind of glass suitable for drying expts. and its cleaning are discussed. Drying app., lubricants and purity of materials are reviewed.
S. LENHER

Notes on intensive drying of gaseous media. WM. A. BONE. *J. Chem. Soc.* 1929, 1664-6.—A review of B.'s work.
S. LENHER

The drying of solids. II. T. K. SHERWOOD. *Ind. Eng. Chem.* 21, 976-80(1929).—The third case in the drying of a solid referred to in an earlier article (cf. *C. A.* 23, 1451) is non-existent. All wet solids dried under const. conditions exhibit a period of const. rate of drying, followed by one of falling rate. During the former the drying is like the evapn. of H_2O from a free liquid surface; the effect of adjoining dry surfaces, of radiation from surroundings and of air velocity upon the drying are presented by equations and graphs. The falling rate period is divisible into 2 zones: (a) following the crit. point, characterized usually by a linear relation between the rate of drying and H_2O content, and (b) marked by a curve concave upward when the rate of drying is plotted vs. H_2O content. In the former the rate of drying decreases because of a decrease in the wetted surface, and in the latter, internal liquid diffusion controls the drying. An empirical equation is proposed which serves as a basis of calcs. in drier design, and its use illustrated.
W. C. EBAUGH

Vaporization of complex mixtures. WALTER J. PODBIELNIAK AND GEO. G. BROWN. *Ind. Eng. Chem.* 21, 773-9(1929).—Fundamental equations applicable to the continuous and differential vaporization processes were derived and checked by comparison with exptl. data. A sample of natural gasolines was used in this investigation. The two different processes were studied experimentally and theoretically and 9 specific conclusions were reached.
E. S. WALLIS

The recovery of volatile vapors and gases by means of active carbon. W. KARSTEN. *Teer u. Bitumen* 27, 445(1929).—A discussion of the well-known principles of charcoal absorption of gases.
W. H. STABNER

Heat transfer by condensation in saturated and superheated steam. M. JAKOB AND S. ERK. *Z. Ver. deut. Ing.* 73, 761-2(1929).—Exptl. results are given on heat transfer through the walls of a vertical tube externally cooled. Superheated or satd. steam was used; it passes through the tube. Results show that heat transfer decreases with increasing wall temp., and increases with increasing steam flow. In general, the heat transfer from superheated steam was greater than that from satd. steam. Results agree with values deduced from Nusselt's theory of surface condensation.
C. Z. ROSECRANS

Flow resistance of gas-oil mixtures through vertical pipes. L. C. UREN, P. P. GREGORY, R. A. HANCOCK AND G. V. FESKOV. *Am. Inst. Mining Met. Eng., Tech. Pub.* No. 252, 13 pp.(1929).
E. J. C.

Cleaning air by the adhesive impingement method. J. H. MILLIKEN. *Iron Steel Eng.* 6, 521-5(1929).
W. H. BOYNTON

Refrigerating characteristics of carbon dioxide. W. R. WOOLRICH. *Power Plant Eng.* 33, 1021-4(1929).—Although presenting many mech. disadvantages in prepn., CO_2 has many unusual characteristics. It is odorless and can be shipped and used in solid, compressed form. Its property of self-insulation greatly increases its heat absorbing properties. Many data are included.
D. K. FRENCH

Sulfur dioxide. Its characteristics as a refrigerant. W. R. WOOLRICH. *Power Plant Eng.* 33, 805-8(1929).— SO_2 is considered applicable to small refrigerating units. Comprehensive charts and much data are included.
D. K. FRENCH

Low-humidity drying (TOMLINSON) 2. Some radiation heat transfer formulas (SAUNDERS) 2. Heat transfer: a liquid flowing through a porous prism (SCHUMANN) 2.

System of partial liquefaction for separating hydrogen from gaseous mixtures such as coke-oven gas. GEORGES CLAUDE (to Soc. l'air liquide, Soc. anon. pour l'étude et l'exploitation des procédés Georges Claude). U. S. 1,730,806, Oct. 8. An app. and various details of procedure are described.

Refrigerating system utilizing mixed crushed ice and water. CROSBY FIELD (to Flakice Corp.). U. S. 1,730,922, Oct. 8. An app. is described.

Refrigerating apparatus of the absorption type. CARL G. MUNTERTS (to Electrolux Servel Corp.). U. S. 1,729,625, Oct. 1. Structural features.

Refrigerating apparatus of the compression type. CARL P. BROCKWAY (to Industrial Research Corp.). U. S. 1,730,116, Oct. 1. Structural features.

Refrigerating apparatus of the compression type. IVAR LUNDGAARD (to Devon Mfg. Co.). U. S. 1,730,580, Oct. 8. Structural features.

Waterproof wrapping cloth. CHARLES H. PANTHEN (to General Electric Co.). U. S. 1,729,681, Oct. 1. Fabric such as strong open weave cloth is rendered suitable for wrapping elec. machinery by impregnation with a mixt. of soft adhesive pitch with about 7% its quantity of mineral oil adapted to prevent hardening of the pitch.

Insulating filament. HENRY A. GARDNER. U. S. 1,730,417, Oct. 8. Artificial cellulosic filaments suitable for use as an insulation similar to silk are prep'd. contg. an elec. non-conductive resin such as a phenol-CH₂O synthetic resin and a finely divided non-conductive micaceous substance in sufficient quantities to produce an elec. non-conductive effect.

14—WATER, SEWAGE AND SANITATION

EDWARD BARTOW

Water resources activities in North Carolina. CHARLES E. RAY, JR. *J. Am. Water Works Assocn.* 21, 1196-1205(1929). D. K. FRENCH

Manganese in the water supplies of New Jersey. LEROY FORMAN. *J. Am. Water Works Assocn.* 21, 1212-7(1929).—Mn affected the *o*-tolidine test for Cl and made it unreliable, 0.1 p. p. m. Mn in manganic form gave a color corresponding to 0.13 p. p. m. residual Cl. A method is outlined which should easily and accurately det. 0.02 p. p. m. Mn in water. D. K. FRENCH

London water supply. ALEXANDER HOUSTON. *Twenty-third Ann. Rept., Water Works and Sewerage* 76, 371-2(1929).—Chlorination of the Thames water has reduced the amt. of necessary pumping to reservoirs and increased the amt. of water filtered per acre of beds cleaned. The prefiltration waters which include raw, stored and gravel water are improved from 100 to 1000 times when compared on the basis of *B. coli* content with the raw river water. Double filtration, that is, filtration through primary roughing filters at high rates followed by filtration either through slow or rapid sand filters at rates higher than customary, has been very successful. C. C. RUCHHOPL

Physicochemical determinations on the potable waters of Milan. FILIPPO PRATO PREVIDE. *Giorn. chim. ind. applicata* 11, 265-6(1929).—The cond. and f. ps. of all the potable waters supplying Milan were measured, and the insol. residues of the waters calcd. from these data. The residues were also detd. chemically. The 2 results showed close agreement, the greatest variation being 0.375 g. found and 0.360 g. calcd. A. W. CONTIERI

Quality of water of the Colorado River in 1926-1928. C. S. HOWARD. *U. S. Geol. Survey, Water Supply Paper* 636-A, 14 pp.(1929); cf. Collins and Howard, *C. A.* 21, 2947; 23, 458.—Analyses are given of the water collected at different gaging stations. During 1926-7 (Oct. 1, 1926 to Sept. 30, 1927) the av. load of dissolved material amounted to 36,600 tons per day at Grand Canyon, 37,400 tons at Topock and 39,100 tons at Yuma, Ariz. For 1927-8 (Oct. 1, 1927 to Sept. 30, 1928) the resp. values were 29,400 at Grand Canyon and 26,200 at Yuma. The mean total hardness was 285 p. p. m. in 1926-7 and 254 p. p. m. in 1927-8, as compared with 251 p. p. m. in 1925-6. G. S.

British rainfall, water consumption and water treatment. M. N. BAKER. *Eng. News-Record* 103, 497-500(1929).—Data are given on the recent drought and water shortage, water consumption and water treatment in Great Britain. The consumption in 80% of the cities is between 12 and 47 U. S. gal. per capita per day. Of the 642 supplies tabulated, 241 are filtered and only 28 chlorinated. R. E. THOMPSON

Water-pipe practice at Detroit, Mich. GEORGE H. FENKELL. *Eng. News-Record* 103, 410(1929).—During the last few yrs. Detroit has employed steel pipe almost exclusively for mains larger than 36 in., the principal reasons being the favorable cost and the fact that steel pipe is not subject to sudden failures. In recent contract proposals bids have also been invited on pipe of pure Fe or pure Fe plus a small percentage of Cu. The water supply, derived from the Detroit River, has a hardness of about 100 p. p. m. and is non-corrosive. The soil, in general, is also non-corrosive. R. E. THOMPSON

British water-pipe practice and experience. M. N. BAKER. *Eng. News-Record* 103, 405-7(1929).—An outline of practice in Great Britain. For distribution mains, cast Fe pipe is usually employed. Bituminous coatings, spun in rather than applied by dipping, are generally used for steel pipe. For external protection, use of "Hessian" soaked in bituminous material is quite general. In the clayey London soils, cast Fe pipe sometimes becomes so soft ("graphitic") that it can be cut with a knife. This was formerly attributed to electrolytic action due to inequalities in the Fe, but recent studies seem to show that softening is caused by "clay bacteria." Cast Fe pipe is now surrounded with gravel when laid in clayey soils.

R. E. THOMPSON

Water-works intakes at Hamilton, Ont. H. S. PHILIPS AND JAMES STODART. *Contract Record & Eng. Rev.* 43, 241-4(1929).—The water supply of Hamilton originated in 1859, the source then being infiltration basins on the shore of Lake Ontario. Several intakes have since been constructed which draw water from the lake. The new 60-in. steel intake, constructed in 1926 to avoid a repetition of the ice-blocking experienced in 1923, is described in some detail. The max. velocity of flow through the intake ports will be 1.45 sec.-ft. Before entering the pumping station, the water passes through traveling screens which are housed in the same building as the chlorination equipment.

R. E. THOMPSON

Surface water supply of the United States, 1924. XII. North Pacific Slope drainage basins (B) Snake River basin. NATHAN C. GROVER, G. C. BALDWIN, G. L. PARKER, C. G. PAULSEN, A. B. PURTON AND F. F. HENSHAW. *U. S. Geol. Survey, Water Supply Paper* 593, 264 pp.(1929). (C) Lower Columbia River basin and Pacific Slope drainage basins in Oregon. NATHAN C. GROVER, F. F. HENSHAW AND G. L. PARKER. *Ibid* 594, 215 pp.(1929).

G. SCHWOCH

Surface water supply of Hawaii, July 1, 1923, to June 30, 1924. NATHAN C. GROVER, E. D. BURCHARD AND M. H. CARSON. *U. S. Geol. Survey, Water-Supply Paper* 595, 154 pp.(1929).

G. SCHWOCH

Ground water in the Pomperaug Basin, Conn., with special reference to intake and discharge. OSCAR E. MEINZER AND NORAH D. STEARNS. *U. S. Geol. Survey, Water Supply Paper* 597-B, 73-146(1929).—Some analyses of ground and river water are included.

G. SCHWOCH

Further contributions on the differentiation of organic matter in water. The chlorine combining power of ground water. K. KEISER. *Techn. Gemeindeblatt* 32, 195(1929); cf. *C. A.* 23, 3999.—The Cl demand of ground water gives valuable information concerning the kinds of org. matter present. The ratio of O demand to Cl demand varies greatly.

A. L. ELDER

Artificial production of ground water. E. GROSS. *Gas Wasserfach* 72, 901-5 (1929).—Methods are described of filtering river water through the banks or from artificial infiltration basins, with a preliminary clarification when necessary.

R. W. RYAN

Occurrence of silicates in natural waters. O. W. REES. *Ind. Eng. Chem., Anal. Ed.* 1, 200-1(1929).—In Illinois, it is customary to det. Ca, Mg, NH_4 , sulfate, nitrate chloride and carbonate and est. Na by the difference in milli-equiv. between the cation and anion contents. Better results are obtained if the sol. silicate is added to the other anions.

W. T. H.

Eighth annual report of Ohio Conference on Water Purification, November 1-2, 1928. (1929). Operation of the McDonald water-softening plant. T. S. WOODWARD. *Ibid* 13 —A brief outline. The water supply, obtained from an abandoned coal mine, is hard and contains a considerable amt. of Fe. Lime softening is employed, which also removes the Fe. **Operation of the water-softening plant at Leroy.** A. E. KIMBERLY. *Ibid* 13.—Although the population is but 350, Leroy has a 25,000-gal. per day, intermittently operated softening plant. The hardness of the well water is 570 p. p. m. and of the softened water 85. Air agitation is employed. The filter sand is becoming incrustated. **Operation of the Westerville water-softening plant.** J. H. WENGER. *Ibid* 13 4.—The softening plant of Westerville, constructed at a cost of \$49,000, consists of dry feed lime, soda and alum machines, 2 mech. mixing chambers, 2 coagulation basins and two 300,000-gal. per day filters. The hardness of the raw water, derived principally from Alum Creek, averages about 300 p. p. m., and of the softened water about 90 p. p. m. The cost of chemicals for softening and coagulation averages about \$28 per million gals. **Operation of the Medina water-softening plant.** A. H. FRETTER. *Ibid* 14-5.—The water supply of Medina, derived from a small creek, is hard and at times very turbid, and carries a high bacterial load. The softening and filter plant has a capacity of 1 million gal. per day and consists of chem. feed machines for lime, Na_2CO_3 and alum, a gravity mixing chamber, 2 coagulation basins with CO_2 diffusers at the effluent end and 2 filters. Prior to adopting carbonation considerable incrustation of the filter sand

occurred. The CO_2 is generated by burning coke, gas contg. 12-18% CO_2 being easily obtained. From 3 to 4% escapes before being absorbed by the water. The gas is drawn from the flues by water injectors, the throats of which are made of brass, Fe having been found to last only 6 weeks. The coke consumption is about 200 lb. per million gal. Use of pulverized quick lime at Portsmouth. F. E. SHEEHAN. *Ibid* 21-2.—Lime treatment is employed at Portsmouth to reduce the CO_2 content and excess lime treatment is substituted for chlorination when the raw water contains phenol. Arching of $\text{Ca}(\text{OH})_2$ in the hoppers of dry feed machines and troubles with insol. cores in pebble lime led to the use of ground burnt lime. Shipped in steel containers or paper-lined burlap sacks, it retains its CaO content indefinitely. It can be applied through dry feed machines without difficulty. There is no heat developed during slaking and the reaction is complete. The unit cost is somewhat less than that for $\text{Ca}(\text{OH})_2$. Desirability of metal instead of concrete for exposed open flumes. J. M. MONTGOMERY. *Ibid* 22.—The concrete flume between the mixing tanks and the Dorr clarifier in the Piqua softening plant failed after being in operation 2 years, and has been replaced with a flume of steel boiler plate. Frost action was particularly severe at the water line. J. W. Ellms reported disintegration of the concrete in the filters at Cleveland. Experiment on using broken stone instead of gravel in filter bottoms. O. F. SCHOFFELE. *Ibid* 23-4.—A 4-in. layer of $2\frac{1}{2}$ in. hard dolomitic limestone was placed beneath the original gravel during reconstruction of one of the filters of the Sandusky plant in June, 1928. No trouble has since been experienced with gravel inversion in this filter, no hard spots have developed and the distribution of the wash water is very even. Successful use of crushed stone at other plants was reported, the irregular-shaped rock staying in place better than rounded gravel. The use of steel vs. concrete for wash water tanks. ANON. *Ibid* 24.—A discussion of the relative merits of steel and concrete, in which experience at several plants is outlined. The chief difficulty with the former is leakage, and with the latter, painting and repairing while in operation. A small sand washer and gravel grader. F. E. SHEEHAN. *Ibid* 25-6.—A description of a machine used during reconditioning of the filters at Portsmouth. The use of carbon dioxide scrubber water for removing sand incrustation. J. M. MONTGOMERY. *Ibid* 26-7.—Carbonation is effected at Piqua with CO_2 produced by burning coke, the gas being scrubbed before being applied to the water. Recently the water used for scrubbing has been passed upward through the filter beds to remove the incrustation on the sand resulting from excess lime softening. The alkyl. of this water after passing through the sand has been found to be as high as 1000 p. p. m. In the discussion which followed, the possibility of corrosion being caused by this practice was suggested. C. P. Hoover suggested recarbonation in 2 stages, near the outlet of the mixing chamber and at the inlet to the filters, to prevent sand incrustation. The Lima water-purification plant. E. E. SMITH, 2ND. *Ibid* 31-8. The source of the Lima water supply is Lima Lake and Lost Creek reservoir, into both of which Ottawa River water is pumped. The filter plant, which has a capacity of 8 million gal. per day, consists of chem. feed machines, carbonation equipment, 2 baffled mixing basins, 2 coagulation basins, 6 rapid sand filters and chlorination app. Application of CuSO_4 in the receiving reservoirs has been found to be an effective remedy for short filter runs due to algae. Since 1925, CO_2 , generated by burning coke, has been applied to the water for reducing the alum dosage. The water is hard, averaging about 222 p. p. m. Suggested plant changes to permit softening to be carried out are outlined. New water supply and water purification plant at Wellston. F. E. SHEEHAN. *Ibid* 39-42.—The water supply of Wellston, obtained from Little Raccoon Creek and Lake Alma, is treated in a 2-million gal. per day plant consisting of aerator nozzles surrounded by a lower wall, mech. mixing chambers, a coagulation basin, 2 rapid sand filters and chlorination equipment. The chambers of the rate controllers serve as effluent sight wells or turbidimeters. Tabulated data on the purification effected during 1928 are included. Proposed re-sanding of the Cincinnati filters. CLARENCE BAHLMAN. *Ibid* 43-4.—The Cincinnati filters, after 21 years' service, are to be re-sanded. The effective size of the sand has increased from 0.34 to 0.50 mm., and the acid-sol. content from 1.1 to 50.8%. The incrustation, an analysis of which is given, has increased the depth of the sand bed from 30 to 38.5 in. No decrease in efficiency due to the coarser sand has been observed. Sand loss during washing is confined to the winter months, probably because of the greater density of the cold water. The reconstructed bed will contain 14 in. of gravel and 23 in. of sand. A portion of the old sand will be mixed with new Ohio River sand, purchased at \$1.60 per ton delivered. The equipment used for grading the sand is described. Approx. 73% of the new crude sand is being utilized. In discussion, J. W. Ellms reported that more sand was lost during washing in winter at Cleveland also, because of the greater viscosity of the cold water. During hot weather a 39-in. rise of wash water can be employed, while

in winter the rate is reduced to 24 in. per min. Water softening for small municipalities. CHARLES P. HOOVER. *Ibid* 45-52.—A general discussion of water softening for cities with water consumption up to 1 million gal. per day, and a description of the softening plants at Batavia and New Richmond. The softened water should have a hardness of 70-80 p. p. m. The plant at Batavia, treating Little Miami River water, is of the fill and draw type and consists of chem. feed equipment, 2 settling basins, carbonation chamber and two 0.25-million gal. per day rapid sand filters. Mixing is effected by compressed air. The CO_2 -generating equipment consists of a combined oil furnace, washer, scrubber and dryer. The lime-soda plant at New Richmond consists of 2 wells, chem. feed devices, a combined mixing (baffled) and settling tank, recarbonation equipment and 2 pressure filters, the rated capacity being 0.864 million gal. per day. In discussion, the Glendale fill and draw, lime-soda plant was described. The well water has a hardness of about 290 p. p. m., and the softened water usually varies between 50 and 60. Recarbonation is not employed and the filter sand and hot water pipes are becoming incrustated. The Lowellville zeolite water-softening plant. W. H. KNOX. *Ibid* 53-5.—The new zeolite softening plant at Lowellville is the first municipal plant of this type in Ohio. The capacity of the plant is 350,000 gal. per 24 hrs., but it is only operated for 6 hrs. each day. The water flows upward through 2 ft. of gravel and 9 ft. of zeolite. For regeneration, brine is applied to the top of the filter. The wash water used is approx. 6% of the water softened. The raw well water, which has a hardness of 285 p. p. m., is mixed with the softened water in the proportion of about 19 to 81, giving a product of about 80 p. p. m. hardness. The chem. cost is about 2.8¢ per 1000 gal. of water softened, or 1.36¢ per 1000 gal. per 100 p. p. m. reduction in hardness. The cost of pumping is 3.14¢ per 1000 gal. Bactericidal action of lime in sub-caustic doses. CLARENCE BAHLMAN. *Ibid* 56-9.—Excess lime treatment, sufficient being added to give a caustic alk. of 5 p. p. m., has been successfully employed at Cincinnati on occasions when chlorination has been suspended on account of taste. Recent observations and expts. have shown that greater bacterial removals are obtained when more lime is added than required for coagulation but not sufficient to produce causticity. With normal iron and lime treatment, 30 to 45% of the filter influent alk. is in the form of normal carbonates and the p_H value ranges from 9.0 to 9.3. When using the higher lime dosages experimented with, which were 70 to 90% higher than normal, 50 to 80% of the alk. was normal carbonate and the p_H was 9.4 to 9.5. Markedly better *B. coli* reductions were obtained under the latter conditions. B. believes that the higher removals were more probably due to improved coagulation than to destruction of the organisms, the filter effluent always being more brilliant with the increased lime dosages. The method of treatment is suggested for combating unusual pollution. Continuous use would result in sand incrustation. D. H. Rupp, in discussion, stated that a caustic alk. of 15 p. p. m. at Oklahoma City results in a considerable reduction in bacterial content but does not effect sterilization. Research on removal of phenolic tastes in public water supplies. R. D. SCOTT. *Ibid* 60-3.—Results are given of bottle expts. on the treatment of water contg. 0.01, 0.1 and 1 p. p. m. of phenol. The Cl_2 -consuming power of ammonia still liquor in distd. water was nearly 1 p. p. m. per 1 p. p. m. of phenol after 20 hrs. contact and the O_2 consumed value 2.6 p. p. m. per 1 p. p. m. of phenol. The O_2 consumed value of pure phenol was 1.8 per 1 p. p. m. The min. concn. of phenol which will cause a taste on chlorination varies with different waters, e. g., at Columbus, 10 parts per billion in the raw water and 0.2 parts per billion in the filtered. The min. concn. of phenol detectable by taste in the absence of Cl_2 is 1 p. p. m. In expts. on superchlorination the dosage required seemed to depend on the Cl_2 absorption in 20 hrs. Only a slight residual need be present at the end of this period. Progressive increases in Cl_2 dosage did not result in corresponding increases in residual Cl_2 . It is suggested that the dosage required to produce the first progressive increase in residual Cl_2 might be designated the superchlorination value of the water, the data indicating that this value is a measure of the Cl_2 dosage required to eliminate chlorophenol tastes. Addn. of KMnO_4 reduces the Cl_2 required to eliminate taste, 1 p. p. m. KMnO_4 being as effective as 4 p. p. m. Cl_2 , compared with their relative oxidizing powers of 1 to approx. 0.9. Addn. of NH_3 prior to Cl_2 in proportion of 0.5 to 1 prevented the production of taste from 0.1 p. p. m. phenol when Cl_2 dosages up to 0.5 p. p. m. were employed. Slight taste developed with higher Cl_2 applications. The residual Cl_2 content is higher with Cl_2 and NH_3 treatment than with Cl_2 alone and increases directly with the proportion of NH_3 used. Taste prevention by this method is probably due to the fact that the affinity of chloramine for org. matter is less than that of Cl_2 . E. Watzl discussed the use of activated C for dechlorination. The ratio of C destruction to Cl_2 removed is approx. 1:6. The products are CO_2 and HCl . Filtration rates of 24 to 72 gal. per sq. ft. per min. can be maintained through beds of C 5 ft. deep. The most suitable

size of C is 0.2 in. The phenol recovery and treatment works of the Hamilton Coke and Iron Company, Hamilton, Ohio. B. F. HATCH. *Ibid* 64 9.—See C. A. 23, 3042. Results obtained in phenolic wastes disposal under the Ohio River basin interstate stream conservation agreement. F. H. WARING. *Ibid* 70-80.—See C. A. 23, 4518.

R. E. THOMPSON

Purification experiments on raw water. FRITZ DILLER. *Wochbl. Papierfabr.* 60, 831-2; *Papier-Fabr.* 27, 521-3(1929).—Water taken from a bog varied considerably in O demand, hardness, Fe and Mn content, color and suspended matter with the season. Purification by $\text{Al}_2(\text{SO}_4)_3$ (I), by $\text{Ca}(\text{OH})_2$ and $\text{Al}_2(\text{SO}_4)_3$ (II) and by H_2SO_4 and $\text{Al}_2(\text{SO}_4)_3$ with p_{H} control (III) were compared. I was satisfactory except that it failed to remove the Mn, which would upset bleach plant operation. II removed Mn, but required careful chem. control both in the dosage and in acidifying after filtration to improve the color. III gave more rapid coagulation than either I or II (20 min. vs. $3\frac{1}{2}$ hrs.) but again failed to remove Mn. This can be removed by filtration through a layer of manganous pyrites, which is expensive. The p_{H} 5.5 giving best purification in III was too acid for complete removal of Mn in this way. Complete analyses before and after the various treatments are given.

R. H. DOUGHERTY

Electroosmotic water purification. A. S. BEHRMAN. *J. Chem. Education* 6, 1611-8(1929); cf. C. A. 22, 475.—The demineralization of water may be carried to 10 p. p. m. with a 3-compartment cell. Water purified by electroosmosis compares very favorably with distd. H_2O in purity. Com. installations for ice manuf. are being developed. The only attention required for the app. is the periodic cleansing, every 2 weeks, of the diaphragms by immersion, first in dil. HCl and then in H_2O . C. R. F.

Purification of water by electroendosmosis; the preparation of distilled water by electroendosmosis. K. ILLIG. *Chem. Listy* 23, 408 16(1929); cf. C. A. 23, 459.—Electro distn. is not economical; electroosmosis requires a small space, simple app. and small currents or heat. The hardness of H_2O may be decreased to any degree. This is primarily a review.

FRANK MARESH

Water purification by base exchangers. F. DIENERT. *Chimie & industrie* 22, 249-58(1929).—A brief review of the constitution and properties of artificial zeolites, and of their use and merits for softening water.

A. PAPINEAU-COUTURE

Sterilizing flooded wells. L. S. FINCH. *Monthly Bull., Indiana State Board Health* 32, 19(1929); *J. Am. Water Works Assocn.* 21, 1100.—A heaping tablespoonful of chloride of lime per 100 gal. of water is recommended unless the well has been grossly polluted, when it should be pumped out clean and allowed to refill.

D. K. FRENCH

Katadyn, a new process for the sterilization of water. G. A. KRAUSE. *Schweiz. Apoth. Ztg.* 67, 97-9(1929); cf. C. A. 23, 1452, 1702, 4518.

S. WALDBOTT

Prechlorination and filtration. E. F. DUGGER. *Munic. News and Water Works* 76, 354(1929).—The water from an 844 mg. reservoir (a 200-day supply) is filtered through a rapid sand plant. To 1922 alum was used as a coagulant and filtration costs were \$12.53 per mg. Prechlorination with alum treatment was started in 1923 and better coagulation was obtained resulting in a saving in filtration costs. In 1928 filtration cost with prechlorination and final chlorination was \$7.65 per mg.

C. C. R.

Improvement of taste of chlorinated drinking water by use of activated charcoal filters. KARL IMHOFF AND F. SIERP. *Public Works* 60, 308-9(1929).—See C. A. 23, 4288.

C. C. RUCHHOFF

Operating experiences with large-capacity filter plant. J. CLARK KEITH. *Munic. News and Water Works* 76, 299-301(1929).—The purification plant of the Essex Border Utilities Commission located at Windsor, Ont., has a daily capacity of .21 million imperial gal. The plant is owned by 9 communities and serves 120,000 people. In the spring of 1928 FeSO_4 and hydrated lime were used as coagulants in an effort to increase the length of filter runs during the algae period. Their use increased the min. run from $1\frac{1}{2}$ to 10 hrs. Approx. 15% more wash-water was required when iron and lime were used as coagulants. Mudballs were removed by fishing in the filter beds with a wire-mesh scoop. Lab. control includes daily plankton counts. An attempt will be made to correlate these with the service hours of the filters. Av. costs per mg. include coagulants \$2.09, salaries \$4.28, power \$2.74 and maintenance \$1.24.

C. C. RUCHHOFF

Experiences in zeolite softening. D. E. DAVIS AND J. T. CAMPBELL. *Water Works Eng.* 82, 1153-4, 1169(1929).—A tabulation shows comparisons between the 4,000,000-gal. pressure type softener of the Ohio Valley Water Co., near Pittsburg, Pa., and the 2,000,000-gal. open type softener at Sewickley, Pa. (cf. C. A. 23, 3038). Data and graphs on the operation of the Sewickley plant are given. With the same quantity of salt, a 5% soln. removed 4004 grains of hardness per cu. ft. of green sand (av. 15 runs) while an 8.6% soln. removed 3790 grains (38 runs). The av. salt doses were, resp., 0.334

and 0.353 lb. of salt per 1000 grains of hardness removed. The more dil. soln. apparently allows the salt to bathe each sand grain for a longer period than the more concd. soln. and effects a more complete exchange of Na.

C. H. BADGER

Reduction of carbonate hardness by lime softening to the theoretical limit. CHAS. P. HOOVER AND JAMES M. MONTGOMERY. *J. Am. Water Works Assoc.* 21, 1218-24 (1929).—Ordinary softening with CaO can produce sol. basic Mg compds. To soften to the theoretical limit, excess lime is recommended, followed by recarbonation to remove the excess. It is claimed that this addn. of CO₂ will not make the water more corrosive.

D. K. FRENCH

Coagulation of highly colored waters. W. W. WATKINS. *Munic. News and Water Works* 76, 221-3 (1929).—The Norfolk, Virginia, water supply is obtained from 2 sources. The first, from lakes dammed off from Chesapeake Bay, has a color of 50 to 60 on the Pt Co scale and sometimes reaches 160, and an av. turbidity of 25 with occasional turbidities to 5000. The second, at Lake Prince, has a color of 70 with turbidity from 50 to 200. The combined capacities of the 2 plants are 28,000,000 gal. daily. Prior to 1923 the treatment consisted of the addn. of 2 grains of Al sulfate per gal., settling for 4 hrs., filtration through rapid sand filters, CO₂ reduction with lime and chlorination. Expts. were carried on in the use of liquid Cl in coagulation and a permanent installation was later made. The Cl was applied to the raw water 1 min. ahead of the alum. Six lb. of Cl per million gal. of water were used, maintaining a residual of 0.1 p. p. m. A max. color reduction is obtained by this treatment; filter runs are increased from 16 to 24 hrs.; filter beds are kept in better condition and there is a reduction in bacterial loading.

C. C. RUCHHOFF

Chlorinated copperas as coagulant. A. C. DECKER AND H. G. MENKE. *Munic. News and Water Works* 76, 246-7 (1929).—Chlorinated copperas was found to be practical, economical and efficient in water treatment at the new plant at Chickasaw, Ala.

C. C. RUCHHOFF

The bottled mineral waters. Investigations on their p_H and their content of coli bacilli and other bacteria. JEAN BANCE AND LOUIS CAILLON. *Arch. Inst. Pasteur Tunis* 18, 199-201 (1929).—The p_H was detd. in 21 (apparently French) bottled mineral waters. The values found ranged between 6.0 and 7.6, but different samples of the same brand gave very close checks. Little difference existed between the p_H of bottled and fresh mineral water. The no. of bacteria per cc. was between 0 and 10 in 10 cases, between 10 and 100 in 5 cases, between 100 and 1000 in 3 cases and 400,000 in 1 case. Several waters contained a large no. of molds. Only 1 brand contained coli bacilli (200-500 per l.).

G. SCHWOCH

Experimental studies on the phthalin reaction of certain mineral waters. O. BAUDISCH AND H. V. EULER. *Biochem. Z.* 212, 149-57 (1929).—The phthalin reaction (0.6 cc. of a soln. of 2 g. phenolphthalein and 20 g. NaOH in 100 cc. H₂O reduced with 15 g. Zn-dust, 0.5 cc. 0.01 N H₂O₂ and 0.5 cc. of the tested soln.) is distinct even with 0.00001 mg. hemin-Fe. Various mineral waters (like Saratoga, etc.), were found to give this reaction.

S. MORGULIS

One plant replaces three at water station. C. V. BUCHER. *Ry. Eng. Maintenance* 25, 416-8 (1929).—Trouble with muddy and corrosive water from Leading Creek and the Ohio River at the Hobson, Ohio, terminal of the New York Central RR., was overcome by installation of shallow drilled wells. Automatic electrically operated centrifugal pumps are used in 36 ft. pits. A clear satisfactory water is obtained.

R. C. B.

Reducing corrosion. W. F. DAY. *Munic. News & Water Works* 76, 239-40 (1929).—To ameliorate conditions of the water at Staunton, Va., where red water and iron rust had developed, 60 lb. of NaOH per 1,200,000 gal. of water were used. Cold water pipes were cleared but the hot water continued to give trouble. Stoppages in service and house pipes also appeared owing to tuberculation. A treatment plant is being constructed at a cost of \$14,000 to treat the water with lime, NaOH or Na silicate in order to reduce the future corrosion of the pipe system. To remove the corrosion and stoppage already existing 10% H₂SO₄ was used. Dry steam has also proved quite successful.

C. C. RUCHHOFF

Steel used for large water mains in New York City. WM. W. BRUSH. *Eng. News-Record* 103, 408-9 (1929).—Cast-iron pipe has been abandoned for mains larger than 30 in. in diameter, because of the no. of breaks experienced. Steel mains should be cleaned and recoated in place every 15-25 yrs. Specifications require that the welded longitudinal joints show virtually 100% of the plate strength, break outside the weld in the tensile test and bend cold 180° around a 2 1/4-in. pin without sign of fracture. Single-riveted circumferential joints are employed but are not considered satisfactory as they develop only 56% of the plate strength.

R. E. THOMPSON

Cast iron, steel or reinforced concrete. CALEB M. SAVILLE. *Eng. News-Record* 103, 400-4(1929).—Detailed discussion of choice of material for large water pipe, particularly for mains from sources of supply to the distribution system, from the standpoint of experience at Hartford, Conn. Steel is much more susceptible to corrosion than cast iron. Reduction in carrying capacity of mains in Hartford due to tuberculation has been found to be as much as 28% in 15 yrs. Field coating applied to abrasions is seldom or never as permanent as that applied in the shop. Details are included of "Pabco Soil Proof Wrap," which has been successfully used on steel pipes in the West for some years.

R. E. THOMPSON

Chemical treatment of hydraulic dam cores. F. E. HANCE. *Eng. News-Record* 103, 542(1929).—Research on soil materials available for dam construction in Honolulu disclosed the fact that many of the mountain sandy loams or silts were highly acid in reaction and when agitated with water formed a semi-permanent dispersion without imparting their acidity to the water. On neutralization with soda ash the soil immediately flocculates, forming a well-defined granular deposit of greater permeability than the original soil. If, however, sufficient alkali is added to give a pH value of approx. 10, the pptd. material is of the nature of fatty clay and is 200 to 1000% more impermeable, the voids being reduced to a remarkable extent. The application of the principle to the construction of dams is suggested and is being tried out.

R. E. THOMPSON

Chlorinated copperas and ferric chloride as coagulants. L. H. ENSLOW. *Munic. News and Water Works* 76, 227-9(1929).—Chlorinated copperas as a coagulant is proving to be more effective and cheaper than the older coagulants, alum and copperas with alum. The theory is that the copperas ($FeSO_4 \cdot 7H_2O$) alone has no coagulating effect but the oxidation by chlorination to the ferric state produces rapid coagulation. Ferric Fe produced from the cheapest Fe salt, copperas, and the cheapest oxidizing agent, Cl, makes this process desirable. The copperas is dissolved in a vat which leads to the raw water through a corrosive resistant pipe line. Beyond the vat Cl water is introduced into the pipe line through a rubber hose. One part of Cl to 8 parts of copperas is used. Waters having wide ranges of pH values are efficiently treated with ferric salts. Cost data are given.

C. C. RUCHHOFF

Trickling filter dosing. ANON. *Munic. News and Water Works* 76, 214(1929).—A small experimental sprinkling filter with an area of 0.0016 acre is described. The filter gave a rate of about 2,000,000 gal. per acre per day.

C. C. RUCHHOFF

The fauna of an experimental trickling filter. WM. W. FRYE AND ELMERY R. BECKER. *Sewage Works J.* 1, 286-308(1929).—Protozoan forms were found in abundance in all parts of the filter. Metazoa were also found in all parts but predominated in the lower section. The metazoa increased before sloughing and decreased after sloughing was complete. The opposite was true of the protozoa. The 2 forms fluctuated also with changes in rate of flow and concn. of the wastes. Ten species of *sarcodina*, 9 of *mastigophora* and 14 of *infusoria* were identified. Of the metazoa, forms of *Turbellaria*, *Rotatoria*, *Gastrotricha*, *Nematoda* and *Anneluda* were identified.

E. HURWITZ

Regulation of river pollution. EDWARD ARDERN. *Public Works* 60, 141-2(1929).—A. would set as the min. pollution control requirement the prevention of nuisance and menace to Public Health. He favors the election of River Boards representing all the interests concerned (public, industrial, agricultural, fisheries) to have control over a river, to det. the permissible degree of pollution, to coordinate the control of the existing treatment plants, and to det. and build any new treatment works that would be required to meet the agreed river standard.

C. C. RUCHHOFF

The permissible pollution of water from city sewage purification plants. MAHR. *Techn. Gemeindeblatt* 32, 203-8, 220-4(1929).—The degree of purification necessary depends upon the time, diln. and recreation of the polluted water. Purification should be sufficient so that half the total biochem. O demand is satisfied in 2 days and the dissolved O of the water is not lowered below the usual limits.

A. L. ELDER

The laboratory of the sewage treatment plant. HENRY WEINER. *Sewage Works J.* 1, 358-64(1929).—A chemist's point of view as to what a sewage works lab. should be. Location, ventilation, lighting, storage space, the lab. layout, equipment and app. are discussed in more or less detail.

E. HURWITZ

Encouragement and coordination of sewage research. WILLEM RUDOLPHS. *Sewage Works J.* 1, 276-8(1929).

E. HURWITZ

Some important features of sewage disposal. WYNKOOK KIERSTED. *Munic. News and Water Works* 76, 97-8(1929).—The diln. method of sewage disposal should be supplanted by modern systems involving advance prepn. of sewage. Putrescible matter should be oxidized and suspended matter digested. About 90% of suspended

matter can be removed by settling. Oxidation is accomplished by trickling filters, filtration beds or aeration.

C. C. RUCHHOFF

Trials and tribulations of a sewage works operator. A. W. WYMAN. *Sewage Works J.* 1, 339-42(1929).—W. relates some of the discouraging experiences he encountered at the Pasadena plant and the measures taken to relieve them. Lack of capacity, sludge disposal, air distribution, sludge drying and odors therefrom are the particular offenders mentioned.

E. HURWITZ

Progress of sewage treatment in North America. KARL IMHOFF. *Eng. News-Record* 103, 528-9(1929).—A brief outline is given of observations made during a tour of 40 widely distributed plants in the United States and Canada.

R. E. THOMPSON

Schenectady sewage treatment in 1928. MORRIS M. COHN. *Public Works* 60, 184-5(1929).—The plant was shut down for 3 months in order to clean a trunk sewer and interceptor which had been in service for 13 years. Sludge was withdrawn from the digestion tanks as it became ripe and the plant was put back into operation without any difficulties. All sludge was sold to farmers in 1928 and the demand was not satisfied. The trickling filters returned to efficient nitrification soon after they were put back into operation. The filters reduced the biochem. O demand of the tank effluent by about 67%. The suspended solids in the filter effluent exceeded that in the tank effluent.

C. C. RUCHHOFF

Syracuse sewage treatment works. Summary of four years' operating experience. GLENN D. HOLMS AND W. P. GYATT. *Sewage Works J.* 1, 318-32(1929).—Treatment of sewage consists of screening, grit removal and plain sedimentation in tanks equipped with Dorr clarifiers for rapid removal of sludge. The effluent is discharged without further treatment into Lake Onondaga. The sludge is pumped $2\frac{1}{2}$ miles and disposed of by burial in the lime wastes of the Solvay Process Co. Tables showing the % removal of suspended solids and volume of screenings, grit and sludge removed are given. Construction cost and operating cost data are included.

E. HURWITZ

Blacksburg, Va., sewage treatment plant. R. B. BEGG. *Public Works* 60, 261(1929).—The old plant included an Imhoff tank and contact beds. Secondary sedimentation and glass-covered sludge beds were added and the Imhoff tank was covered and provided with gas collectors to prevent nuisance.

C. C. RUCHHOFF

Sewage treatment at Flint. ANON. *Public Works* 60, 225-7(1929).—The plant at Flint, Michigan, treats an average of 9.6 m. g. d. from a population of 120,000. The plant includes a pumping station, 2 screens and grit chambers and 4 Imhoff tanks. The Imhoff tanks are built on a radial flow plan and consist of 18 hexagonal cells, 6 in an inner ring and 12 in an outer ring. Forty sludge beds are provided. The sewage arriving at the plant is septic and has an av. 5-day biochem. O demand of 326 p. p. m. The tanks have operated satisfactorily reducing the 5-day B. O. D. 54.1%, the total solids 22.2% and the suspended solids 74.8%. The sludge drawn has been well digested with a moisture content of 92.9 and 49.1% org. matter.

C. C. RUCHHOFF

The east side sewage treatment plant of the City of Topeka, Kan. CHARLES A. HASKINS. *Munic. News and Water Works* 76, 339-40(1929).—The plant provides for primary treatment only and is designed for an av. flow of 5.4 m. g. d. The plant consists of a bar screen, grit chamber, 2 Dorr equipped settling tanks, sludge digestion tanks provided with Dorr stirring mechanisms and sludge beds. Chlorination is provided for the influent for odor control and for the effluent to protect water supplies on the Kaw River.

C. C. RUCHHOFF

Sar Bernadino sewage treatment plant. JAMES N. HATCH. *Public Works* 60, 255-9(1929).—The new plant has a capacity of 5 m. g. d. and includes Imhoff tanks, trickling filters, secondary sedimentation tanks and sludge beds. Gas collection and utilization are provided. The plant is also equipped with 4 chlorinators. Cl may be applied at 3 different points ahead of the sprinkling filters for odor control and it may be applied at the influent of the secondary settling tank for sterilization.

C. C. R.

Sewage treatment abroad. WILLIAM RUDOLFS. *Munic. Eng. Sanit. Record* 83, 168-9, 233-4(1929).—See *C. A.* 23, 1707.

C. H. BADGER

Defects at English sewage works. H. C. H. SHENTON. *Public Works* 60, 165-6(1929).—Some English works have by-passes to discharge large quantities of raw sewage directly into rivers without treatment, and though the plant may produce a good effluent a nuisance results. Most English sewers are of the combined type and discharge as storm water any surplus over 3 to 6 times the dry weather flow. The quality of this storm water is often as bad as raw sewage.

C. C. RUCHHOFF

Sewage treatment at Birmingham, England. H. C. WHITEHEAD. *Public Works* 60, 337-40(1929).—The sewage from a population of 1,100,000 is treated in 1 large and 2 small plants. The large plant uses sedimentation tanks, bacterial beds and activated

sludge for a portion of the sewage and utilizes the gases from the digestion tank to operate and light the plant. C. C. RUCHHOFF

Hospital sewage treatment plant. HOWARD E. BAILY. *Public Works* 60, 159-60 (1929).—The sewage treatment plant for the Norfolk County Hospital at South Braintree, Massachusetts, consists of settling tanks, dosing tank and sand filters designed to serve 200 persons. C. C. RUCHHOFF

Sources of error in the determination of organic matter in sewage by the method of Kubel-Tiemann. F. REINHOLD. *Techn. Gemeindeblatt* 32, 215(1929).—Very great errors may occur in the O consumed detn. The principal errors are in the time of heating, character of the material to be oxidized, effect of diln. and the permanganate soln. A. L. KLEDER

Reduction of biochemical oxygen demand of sewage by chlorination. H. G. BAITY AND F. M. BELL. *Sewage Works Journal* 1, 279-85(1929).—The chlorination of sewage exercises a marked effect on the biochem. O demand (B. O. D.). Application of 5 to 7.5 p. p. m. Cl gave no residual and reduced the B. O. D. 7.4%. Eight to 9 p. p. m. gave a Cl residual between 0.0 and 0.1 p. p. m. and reduced the B. O. D. 15.5%. Ten to 15 p. p. m. gave a residual between 0.2 and 0.5 p. p. m. and reduced the B. O. D. 42.7%. The av. of the entire series (39 tests) showed a B. O. D. reduction of 31.7%. Cl can be advantageously applied (1) to retard decompn. in a small stream until sewage can be carried to a point where adequate diln. is afforded; (2) as an adjunct to treatment plants which, though operating efficiently, are not affording the required degree of treatment; (3) as an adjunct to overloaded treatment plants, and (4) for intermittent use on sewage or sewage effluents during dry seasons of the year when the stream flow is low. E. HURWITZ

Suspended and settleable solids in Worcester sewage and Imhoff tank effluent. ROY S. LANPHEAR. *Sewage Works J.* 1, 347-53(1929).—Extensive expts. show that erroneous results are obtained for suspended and settleable solids when samples are composited and allowed to stand. This is explained by the presence of colloidal solids which are easily coagulated. The error is further aggravated by the presence of industrial wastes, particularly lime wastes. E. HURWITZ

Effect of age of fresh solids on digestion. H. HEUKELEKIAN. *Sewage Works J.* 1, 309-17(1929).—No significant differences in the rate of digestion were found between strictly fresh solids and solids allowed to septicize for periods up to 20 days when the solids were properly seeded and incubated at 70° or 80° F., or between neutralized and seeded septic solids and fresh solids. The gas yield from seeded mixts. of septic solids was lower than that from seeded fresh solids. A reduction of 9 to 13% was obtained from solids aged 12 days. E. HURWITZ

Brushwood bacteria beds in South Africa. ANON. *Public Works* 60, 260(1929).—A brief description is given of a sewage filter bed filled with brushwood instead of stone, operated at a rate of 2.75 m. g. d. per acre and delivering a good effluent. C. C. RUCHHOFF

Sludge disposal in Germany. ANON. *Public Works* 60, 163-5(1929).—This is an abstract of a report of a comm. of Manchester, England, on a no. of German treatment plants with regard to sep. sludge digestion and gas utilization. The plants at Essen Frohnhausen, Essen Nord, Rellinghausen, Bochum, Berlin, Munich, Stuttgart and Cologne, all of which utilize the gas produced, are described. The Emschergerossenschaft is building a river purification plant at Karnact. This plant will include 4 sedimentation tanks and will provide a one-hour settling period for 187 million gal. daily. In the Ruhr Valley complete treatment is required in 1 zone of the river from which water supplies are drawn through infiltration galleries. Conclusion: Sludge digestion and utilization are usually the best and most economic means of disposal. C. C. R.

Activated sludge plant operation in Great Britain. A. S. M. PARSON. *Water Works and Sewerage* 76, 397-9(1929).—Three stages of the activated sludge process, clarification, reactivation or restoration of the powers of clarification and nitrification, are discussed. Expts. are described designed to det. the cause of the clarification and it is shown that the clarification reaction follows the adsorption equation of Willard Gibbs. It is inferred from the agreement with the adsorption formula and the loss of activity during clarification that the clarification stage is a phys. or chem. reaction and that the biological work is done during the reactivation or restoration of the power of clarification. It is suggested that the activated sludge process should be sep'd. into the various stages for the more efficient operation of each stage. C. C. RUCHHOFF

Lawton's activated sludge plant. WEBSTER B. BENHAM. *Public Works* 60, 302-6 (1929).—The new plant at Lawton, Okla., is an activated sludge plant of 1 m. g. d. capacity using Simplex mech. aerators. The plant includes 10 aeration tanks, a Dorr

equipped secondary settling tank, a sludge digestion tank, a sludge drying bed and an effluent chlorination chamber. C. C. RUCHHOFF

Results at the Pasadena activated sludge plant. JAMES N. HATCH. *Public Works* 60, 129-32, 186 (1929).—The plant described treats about 7 million gal. of domestic sewage per day. The sewage is screened, aerated in activated sludge tanks and settled in tanks equipped to remove the settled sludge. The clarified effluent is chlorinated at the rate of 25 p. p. m. and is then used for irrigation. The sludge is dosed with 10-14 lb. of alum and 7-14 lb. of Filter Cel, is re-aerated for $4\frac{1}{2}$ hrs. and is filtered through Oliver filters. The sludge is dried in Ruggles-Coles type revolving kilns and is sold for fertilizer. Operating costs in 1928 were \$73.00 per million gal. of sewage and a revenue of \$13.00 per million gal. of sewage was obtained from the sale of fertilizer. C. C. R.

Handling activated sludge on covered beds. WELLINGTON DONALDSON AND A. LAWRIE KURTZ. *Sewage Works J.* 1, 333-8 (1929).—By increasing the rate of return sludge and by doubling the aeration period it was possible to condition the sludge so that it would dry readily on glass-covered beds provided it was not retained in the clarifier. For this purpose the sludge was drawn directly on to the beds from the return sludge line. The beds have been operated equally successfully in winter and in summer. A cake 1 in. thick and contg. 20 to 25% dry solids was produced in 4-5 days. The cake is easily handled with a lifting fork. F. HURWITZ

A county-wide sanitary and health survey. MILFORD E. BARNES. *U. S. Pub. Health Repts.* 44, 2315-30 (1929).—This paper deals with the data compiled during a sanitary and health survey of Darke County, Ohio. The typhoid fever rate is fairly low but not negligible. Undulant fever is a real danger. Water supplies need further safeguarding. The milk supply is being safe-guarded. Methods of sewage disposal are far from ideal. J. A. KENNEDY

A study of rural school ventilation. The school ventilation study in Cattaraugus County, N. Y. THOMAS J. DUFFIELD. *U. S. Pub. Health Repts.* 44, 2383-410 (1929). J. A. KENNEDY

Dust and germ content of air in schools. M. GRÜNEWALD. *Haustech. Rundschau* 32, 241; *Wasser Abwasser* 25, 95. —The influence of ozonization upon the dust and germ content was studied. F. P. GRIFFITHS

House-fly fumigation experiments with calcium cyanide. C. O. EDDY. *S. Carolina Agr. Sta. Bul.* 256, 48 p. (1929); cf. *C. A.* 20, 1490; 23, 3534.—To verify previous recommendations (*C. A.* 21, 3249) house flies (*Musca domestica*) were fumigated with HCN evolved from $\text{Ca}(\text{CN})_2$ used in the proportions of $\frac{1}{8}$ to 16 oz. per 1000 cu. ft. The $\text{Ca}(\text{CN})_2$ was distributed in the fumigating room by the dust cloud method. The highest mortality occurred most frequently at the top of the room, the lowest at the bottom. These variations appeared to be correlated with temp. Toxicity depended on concn. of HCN and exposure time. A dosage that gave satisfactory control in 5-6 hrs. was more economical than one that required longer to produce the same result. C. H. RICHARDSON

Refuse in Greater New York. Abstract of Report by REGIONAL PLAN COMMISSION OF NEW YORK. *Public Works* 60, 194-5 (1929).—A summary of the data on garbage, ashes and refuse disposal in New York since 1905 is presented. The conclusions reached are that the practice of dumping garbage at sea is wasteful and unsanitary and that incinerators should be built in the various communities in the region. C. C. R.

Garbage digestion at Dunedin. ANON. *Public Works* 60, 273 (1929).—Garbage is digested in 5 cells of the Beccari type having a capacity of 50 tons of wet garbage per month on a 30-day retention period basis. C. C. RUCHHOFF

Method of preparing and examining thick films for the diagnosis of malaria. M. A. BARBER AND W. H. W. KOMP. *U. S. Pub. Health Repts.* 44, 2330-41 (1929).—Complete details are given. J. A. KENNEDY

Disposal of industrial wastes. JOHN D. RUE. *Sewage Works J.* 1, 365-9 (1929).—Wastes from the pulp and paper industry are discussed. E. HURWITZ

Prevention of percolation through dams (KITTS) 20. Theory of liquid film formation (FOULK) 2. Old and new methods of treating sugar factory waste waters (JASKÓLSKI) 28. The treatment of waste waters from sugar refineries (JASKÓLSKI) 28. Use and control of steam in the sugar industry (GOODNER) 28. The purification of tannery effluents by means of argillaceous colloids (BESSE) 29. Water resources of the upper McKenzie Valley, Oregon (STEARNS) 8.

Treating sewage. CHESTER G. WIGLEY (one-half to Clyde Potts). *U. S.* 1,730,-

489, Oct. 8. Sewage is collected in a substantially closed but aerated receptacle from which the excess moisture is drawn off, leaving the mass of solid matter spread out over the bottom of the receptacle to a suitable depth, the material is sufficiently heated in the presence of a moderate supply of O and lack of sunlight, and there is propagated in it a fungus which permeates the whole mass in a short time and transforms it into a dry flaky or granular condition with practical freedom from malodorous material. An app. is described.

15—SOILS, FERTILIZERS AND AGRICULTURAL POISONS

J. J. SKINNER

Report on agriculture. J. A. VERRET AND A. J. MANGELSDORF. *Proc. Hawaiian Sugar Planters' Assoc., 48th Ann. Meeting 1928* pp. 279-305(1929); cf. *C. A.* **22**, 3718.—Preliminary expts. indicated that application of molasses to cane fields at the last irrigation before harvesting resulted in a somewhat higher purity of the juice. Application of N fertilizers in quantities corresponding to 100-150 lb. N per acre did not, in general, have an adverse effect on the cane juice, but larger quantities of N did. Fertilization with K salts appears to have a favorable effect on the juice of cane grown on certain types of soil. *Chlorotic condition of cane* was largely controlled by 1 or 2 sprayings with 5% FeSO_4 solns. A large increase in the percentage and speed of germination was obtained by soaking cane seed in 0.5% FeSO_4 solns. as compared with soaking in plain water. Promising results were obtained with a mixt. of HNO_3 and H_2SO_4 as a medium for use in the *maturing of female cane tassels*. Refractometer readings indicated that there was no tendency toward the production of poor quality juices from vigorous cane seedlings.

K. D. JACOB

Farming in Matabeleland. H. G. MUNDY. *Rhodesia Agr. J.* **26**, 564-5(1929).—The "Gusi" sand soil is extremely low in fertility as shown by the following analyses of top and subsoils: P_2O_5 0.003, 0.002; N 0.05, 0.04; K_2O 0.0005, 0.0003; org. matter 1.7, 1.3%, resp. By proper methods of farming and by the use of fertilizers this soil is being made to yield good crops.

A. L. MEHRING

South European red earths. H. HARRASSOWITZ. *Chem. Erde* **4**, 1-11(1928).—Red earths beneath the humus-bearing soil of the Black Forest contain in the HCl ext. a higher silica/alumina ratio, namely 2.5-2.98, than those from farther south. The ratio is as low as 0.17-0.5 in the red earth from Lake Garda in Italy. The latter, like the "terra rossa" of the Karst region, contains free alumina. The "terra rossa" rests on pure limestones, and the red color is not confined to the Mediterranean type of weathering.

B. C. A.

The question of "red earth" formation. ADOLF REIFENBERG. *Z. Pflanzenernähr., Düngung u. Bodenk.* **14A**, 257-61(1929).—An answer to criticisms by Harrassowitz (cf. preceding abstr.)

R. M. BARNETTE

Soils. FRANK T. SHUTT. Canada Dept. Agr., *Rept. Dominion Chemist, Year Ending March 31, 1928* 3-14(1929); cf. *C. A.* **23**, 1979.—Mech. and chem. analyses of soils from British Columbia, Ontario, Prince Edward Island, Alberta and Quebec are tabulated. Clay loam soils from the expt. station at Kapuskasing, Ontario, are characterized by a high content of CaCO_3 , the percentages reaching approx. 30 at 3 to 5 ft. *Mine tailings* deposited on farm lands by the spring flood waters of the Massawippi river, Province of Quebec, consisted essentially of Fe pyrites, oxidation of which to H_2SO_4 caused serious damage to crops. Analyses of the top 12 in. of soils from the affected areas showed total S 0.028 to 0.736, sulfide S 0.007 to 0.153 and H_2O -sol. S 0.018 to 0.659%, the pH values ranging from 1.65 to 5.22. The highest concns. of S compds. were in the first 6 in. of soil, but the second 6 in. contained excessive amts

Evaluation of soils from the physical and chemical point of view. J. HASENBÄUMER. *Z. Pflanzenernähr., Düngung u. Bodenk.* **14A**, 140-62(1929).—A discussion and review of the phys. and chem. properties of the soil as related to the value of the soil for cultivated crops, stressing the manifold factors which must be properly evaluated from both phys. and chem. viewpoints.

R. M. BARNETTE

A soil survey of Block E (Renmark) and Ral Ral (Chaffey) irrigation areas. J. K. TAYLOR AND H. N. ENGLAND. Council for Sci. and Ind. Research Australia, *Bull.* **42**, 51 pp.(1929).—A classification of the Renmark soils into 4 main types and an explanation of why some are relatively unproductive, why some are susceptible to salting, why others are difficult to irrigate properly, etc. Suggestions are given as to the

best cultural methods to adopt on the various types to obtain the best com. results. There are 2 maps and 9 tables of mech. analysis. E. F. SNYDER

Chemical and agricultural investigations on soils of Monte Pisano (Tuscany). F. ROGAI AND G. ZWEIFEL. *Boll. ist. agr. Pisa* 4, 575-83(1928).—Chem. and mech. analyses and pH detns. of 28 soils of the Monte Pisano district are tabulated. The N content was 1.12-4.20%, P_2O_5 0.46-4.66% and pH 6.3-6.9. G. A. BRAVO

Soil examination by means of conductivity measurements. W. BENADE. *Z. Pflanzenernähr. Düngung* 12A, 293-309(1928).—Elec. cond. measurements of aq. suspensions of soils during the growth of seedlings mark the period of the intake of nutrients by remaining practically const. Control soils without seedlings show a steady rise in cond. with time. This increased cond. is accompanied by a change of soil reaction toward the alk. side. Cond. of soil suspensions is influenced by the length of the soln. period, by atm. CO_2 and by the activity of microorganisms. Soils which have been once extd. with water, filtered and resuspended in water show an increased cond. The new value is characteristic for each soil and is relatively greater for clays than for sandy soils. Math. relationships are obtained to express changes in cond. in soils with continuous leaching. Soils from which practically all sol. salts have been leached show a general parallelism between cond. and humus content. B. C. A.

The Schulz apparatus for mechanical soil analyses in improved form. E. RAUTERBERG. *Z. Pflanzenernähr. Düngung u. Bodenk.* 14A, 261-8(1929).—An improvement in the elutriating app. of Schulz is given. R. M. BARNETTE

Determination and characterization of organic substances in soil. U. SPRINGER. *Z. Pflanzenernähr. Düngung* 12A, 309-17(1928); cf. C. A. 22, 4700.—Existing methods for examg. soil org. matter are discussed. Oxidation processes for detg. org. matter may give fictitious values if the usual relationship, humus = $1.724 \times C$, is adopted. From 40 to 70% of the soil org. matter is humified, the balance being mainly cellulose, lignin and pectin, with C contents of 44, 56 and 40%, resp., and the humus content is more accurately regarded as $2 \times C$. Wet combustion methods for this type of analysis are recommended. In alk. extn. processes for detg. humified material, values depend on concn. and temp. of the solvent and on the period of extn. Non-humified material may be partially extd. Use of NH_3 extn. leads to difficulty in the sepn. of deflocculated clay from the ext. Fifty % pyridine is not a sp. solvent for humus. Where alk. extd. humus is detd. by oxidation with permanganate, results vary somewhat with the concn. of permanganates used and the period of boiling. The ratio humus-C: total C is valuable in the characterization of soil types; and in the examn. of soil profiles the alkali-extractable C expressed as a percentage of the total C content yields information as to the process of soil formation. B. C. A.

The determination of organic carbon in soils. G. W. ROBINSON, W. McLEAN AND RICE WILLIAMS. *J. Agr. Sci.* 19, 315-24(1929).—It is proposed to est. the amt. of org. C in soils by detg. the amt. of SO_2 produced in the ordinary Kjeldahl digestion. The gaseous reaction products are passed through standard I_2 soln., and the excess I_2 is titrated with standard $Na_2S_2O_3$. Details of the method are given. The results obtained with a no. of soils of differing character and origin are compared with those obtained for org. C by dry combustion. The SO_2 method gives results which average $89.6 \pm 1.03\%$ of the combustion figures. It is, therefore, proposed that the % of org. C found be corrected by the factor $100/89.6 = 1.116$. The % recovery of C indicated by the proposed method is somewhat higher for pure substances but still falls short of 100%. The proposed method is applicable to CO_2 soils without correction for inorg. C. It is likely that soils contg. inorg. reducing substances, such as sulfides, will give high results. By absorbing the SO_2 in 25% $Na_2Cr_2O_7$, it is possible to det. the CO_2 by passing the gases through standard $Ba(OH)_2$. The org. C thus indicated agrees with that by the SO_2 method. From data with certain peats it appears that the factor 1.724 for converting org. C to org. matter is too low. P. R. DAWSON

Determination of total carbon in soils. ERIC WINTERS, JR., AND R. S. SMITH. *Ind. Eng. Chem., Anal. Ed.* 1, 202-3(1929).—The dry combustion with 2 g. charge placed in a boat contg. 0.25 g. of MnO_2 gives better results with 10 min. heating than are often obtained by wet combustion. W. T. H.

Effect of the carbon on the vegetation. II. R. PEROTTI AND C. RUSSO. *Boll. ist. agr. Pisa* 4, 465-501(1928); cf. *Ibid* 3, 15(1927).—The crop-producing power of the soils can be greatly improved by the use of 1-3 quintals of finely divided carbon per hectare. This is due to (1) water-retaining power of carbon, (2) easy adsorption of NH_4 salts and (3) less dispersion of nitrates. G. A. BRAVO

Comparison of methods for determining the saturation capacity of soils. P. A. KUTSCHINSKY. *Z. Pflanzenernähr. Düngung* 12A, 392-411(1928).—The methods of

Hissink, Kappen and of Gedroiz for detg. the exchangeable bases in soils (S) give results in close agreement. For carbonate-free soils, Kappen's method is the most rapid. The detn. of the value ($T - S$) (Hissink) is unsatisfactory in soils of high p_H value or of considerable buffer capacity, because of the turbidity of the liquid to be titrated. Duplicate tests, however, show moderately close agreement. The value ($T - S$) can be calcd. as $6.5 \times$ hydrolytic acidity (Kappen). The time required to bring an acid soil to a definite p_H value can also be calcd. from the hydrolytic acidity (Kappen), using the factors 3 for p_H 7.0, 4 for p_H 7.5, 5 for p_H 8.0 and 6.5 for p_H 8.5. Of the methods for detg. the degree of satn. (V), those of Kappen and Gehring show closest agreement with each other and with field-trial results. Hissink's method gives low results and indicates only 50% of the satn. of alkali soils. Gehring's method is advantageous in that the final satn. of the soil with bases takes place at practically the same soil reaction as obtains under natural conditions. Kappen's method is quicker and more convenient in practice.

B. C. A.

Catalytic properties of soils. K. SCHARRER. *Z. Pflanzenernähr. Düngung* **12A**, 323-9(1928).—The published literature of the catalytic properties of soils toward H_2O_2 and iodides is summarized and discussed, and the essential soil factors concerned are differentiated in the 2 cases.

B. C. A.

Lime requirement of soils. S. GOV. *Z. Pflanzenernähr. Düngung* **12A**, 317-8 (1928).—A brief outline of the chem. methods of examg. acid soils, and their significance.

B. C. A.

The determination of the degree of unsaturation and the lime requirement of soils on the basis of the hydrolytic acidity. J. VON CSIKY. *Z. Pflanzenernähr., Düngung u. Bodenk.* **14A**, 281-94(1929).—A discussion of the different methods of detg. the degree of unsatn. and the lime requirement of soils.

R. M. BARNETTE

Soil reactions and vines with reference to various lime-sensitive varieties. OTTO SARTORIUS. *Z. Pflanzenernähr., Düngung u. Bodenk.* **14A**, 354-70(1929).—Water, sand and soil cultures of several varieties of CaO -sensitive grape vines were made to study the effect of the reaction (p_H value) upon the development of the plant. The grape vines in water cultures made poorer growth with increasing alkali. This injury was the more pronounced in the higher concns. of $Ca(NO_3)_2$. The action of H^+ and OH^- is explained for the most part by their influence on cell permeability. In sand and soil cultures the best growth was obtained with a slightly acid reaction (p_H 6.0-6.5).

R. M. BARNETTE

Comparison between the culture methods of Mitscherlich and Wiessmann [for determining nutrient values of soils]. W. U. BEHRENS. *Z. Pflanzenernähr. Düngung* **12A**, 412-5(1928).—The basis of the methods is examd. mathematically from the point of view of the dependence of the consts. of the growth curves on the nature of the soils and exptl. conditions. In Wiessmann's method the consts. refer to 1 expt. only; those of Mitscherlich are of general application. The accuracy of the results of the pure sand cultures in Wiessmann's method is of vital importance, since they control the corrected values for plant growth in the exptl. sand-soil cultures.

B. C. A.

The application of dialysis and electro-ultrafiltration to the determination of the nutrient requirements of soils. P. KOTTGEN AND R. DIEHL. *Z. Pflanzenernähr., Düngung u. Bodenk.* **14A**, 65-105(1929).—The rapid dialyzing app. of Gutbier-Schieber, the Golodetz extg. dialyzing app. and especially the Bechhold electro-ultrafiltration app. have been used in the sepn. of the molecularly dispersed part of the soil from the coarser dispersed part. By dialyzing a sandy soil, a rapid decrease in the p_H value of the dialyzate was noticed while for a clay the H -ion concn. of the dialyzate changed very slowly. Buffer curves for the soils were thus obtained. By using the rapid dialyzer both with hot and cold solns., it was possible to obtain an idea of the soly. of the P_2O_5 in soil solns. The Golodetz extg. dialyzer was better suited than the rapid dialyzer of Gutbier-Schieber for the study of the easily sol. constituents of the soil and the momentary fertilizer requirements, and also for the relationship between the rate of soln. and the mech. compn. of the soil. The electro-ultrafiltration is the best method of sepg. the difficultly sol. constituents of the soil from the colloidal part. In comparison with HCl extn., citric acid extn. and the Neubauer method, the ultrafiltration method agreed most closely with field responses with P_2O_5 fertilization. The electro-filtration method is also of great value in the study of forest soils and the nutrient supply present in the humus. Significant differences were found in the cond. curves of extns. obtained by the electro-ultrafiltration method from well decompd., less decompd. and undecompd. org. matter. Other possible applications are given.

R. M. BARNETTE

Determination of harmful soil acidity. B. TACKE AND T. ARND. *Z. Pflanzenernähr. Düngung* **12A**, 362-90(1928).—Of the total soil acidity, the active acidity and the

base exchange acidity are injurious to plants. The different sensitivities of various plant species to acidity cannot be fully described in terms of soil acidity alone. It is probable that the neutral point in respect to plant physiology is the same as the chem. neutral point. For the effective detn. of injurious acidity, soils should be exhaustively extd. with neutral salt solns. by percolation. A shorter and more rapid process consists in shaking soil for 1 hr. with normal KCl and CaCO_3 . The CO_2 evolved is a measure of the injurious soil acidity. Both org. and mineral soils limed on this basis have a reaction of pH 7. B. C. A.

A rapid electrometric method for determining the chloride content of soils. RUPERT J. BEST. *J. Agr. Sci.* 19, 533-40(1929).—The method described is based on the p. d. set up at the metal-soln. interface when Ag wire, coated with AgCl, is immersed in a soln. contg. Cl ions. Such an electrode is connected, by a 3% agar-satd. KNO_3 bridge, in series with a quinhydrone reference electrode yielding a pos. potential equal to the neg. potential of the Ag-AgCl electrode at the end point of titration of a chloride soln. with AgNO_3 . The 2 electrodes are in series with a tap-key and a galvanometer giving a deflection of 1 division per micro-amp. No potentiometer is used and no external resistance is necessary with such a galvanometer. Four g. of soil is weighed into a 150-cc. Pyrex beaker, about 50 cc. of distd. water added and the suspension shaken by hand for a few sec. and allowed to stand for 5 min. The beaker is then raised so that the Ag-AgCl electrode and the agar tube dip into the suspension, and the tap-key is depressed. The initial deflection gives a rough idea of the amt. of AgNO_3 required. The titration is commenced and the above procedure repeated after each addn. Vigorous stirring with a glass rod is necessary. The galvanometer pointer reverses direction within the range of 0.5 drop. The soil: water ratio has no effect on the amt. of Cl brought into soln.; the same value was obtained for a 1:5 ratio as for a 1:12.5, with soils of high (0.5%) and low (0.002%) Cl content. P. R. DAWSON

Errors in the determination of humus in soils. M. COUTURE. *Giorn. chim. ind. applicata* 11, 149-50(1929).—Three main sources of error in the detn. of humus in the soils are (1) lack of homogeneity of the sample as well as its not being representative; (2) incomplete decompn. of the sample, particularly in calcareous earths; (3) the presence of other org. matter, not humus, but which cannot be differentiated from it. A. W. CONTIERI

The preparation of humus extracts with neutral reagents. KURT SIMON. *Z. Pflanzenernähr., Düngung u. Bodenk.* 14A, 252-7(1929).—NaF is used as an extg. agent for the humus substances of a soil. R. M. BARNETTE

A rapid approximate method of determining the exchangeable bases in non-calcareous soils. W. N. C. BELGRAVE. *Malayan Agr. J.* 17, 206-9(1929).—A rapid approx. method of detg. total bases by the use of $\text{M}/62 \text{ AlCl}_3$ is described. E. F. S.

The influence of substituted cations on the properties of soil colloids. M. S. ANDERSON. *J. Agr. Research* 38, 565-84(1929).—Changes which different soil colloids may undergo when the exchangeable bases are substituted by different cations are studied. The data considered include detns. of heat of wetting, adsorption of H_2O vapor, swelling, moisture equiv., cataphoresis and pH of 7 widely different colloidal materials when satd. with Ca, Mg, K, Na, H and the cation of methylene blue. The order of cation effects on heat of wetting and moisture adsorption is Ca, Mg, Na, H, K and methylene blue, the last ion giving the lowest values. The decreasing order of effects on the remaining properties is approx. Na, K, Ca, Mg, H and methylene blue. The varying effects of the different cations are ascribed to differences in soly. and dissocn. tendency of the colloid-cation combinations and to the consequent differences in the density and diffusivity of the Helmholtz double layer of the colloidal micelles. Soil colloids vary widely in alterability. Furthermore, the ranges of alteration of the different colloids correlate fairly well with the magnitudes of the properties of the untreated or Ca-satd. materials. M. S. ANDERSON

Studies on nitrate formation in soil. I. The periodicity of nitrate formation. SANDRO LIMBACH. *Zentr. Bakt. Parasitenk., Abt. 2*, 78, 354-75(1929).—Nitrate formation with all outside factors identical to the limits of mensurability still shows periodic changes in intensity. In a culture started in the winter and kept under controlled lab. conditions there was a rise in the rate of nitrate formation in the spring and fall and a corresponding drop in summer and winter. The addn. of a large amt. of vegetable extractives slows the rate of nitrification. JOHN T. MYERS

Buffering, acid thickness, soil zones and uniform nomenclature of individual values of soil conditions. S. GOV, P. MÜLLER AND O. ROOS. *Z. Pflanzenernähr., Düngung u. Bodenk.* 14A, 220-40(1929).—A discussion of the soil acidity question. R. M. BARNETTE

Repair of soil filter tubes. G. J. LARSINOS AND A. B. BEAUMONT. *Soil Sci.* 27, 243(1929).—A method of repair is shown by figure. E. F. SNYDER

The use of dextrin in the isolation and identification of *Azotobacter chroococcum*. C. E. SKINNER. *Soil Sci.* 27, 245-6(1929).—The use of dextrin nitrate agar not only facilitates the isolation of *Azotobacter chroococcum* but also prevents one from considering many strains as non-chromogenic. E. F. SNYDER

The methods of direct examination of the microflora and fauna of soil. The introduction of cyanine dyes into the study of soil microorganisms. M. KOFFMAN. *Zentr. Bakt. Parasitenk.*, Abt. 2, 78, 337-52(1929).—A new Grüber dye, water-sol. cyanide is very useful in the direct demonstration of soil organisms. JOHN T. MYERS

The bacterial flora of the soil in respect to the transformation of phosphate. L. HOROWITZ-WLASSOWA. *Zentr. Bakt. Parasitenk.*, Abt. 2, 78, 172-7(1929).—A number of common saprophytic bacteria are capable of splitting phosphates. J. T. M.

The phosphate question. I. The phosphate content of soils and the phosphoric acid fertilization. O. ARRIENIUS. *Z. Pflanzenernähr., Düngung u. Bodenk.* 14A, 121-40(1929).—From a no. of expts. carried out in the field, and from studies of the solv. of soil P_2O_5 in 2% citric acid, it is concluded that a close relationship exists between the P_2O_5 need as indicated by the vegetation expts., and the results of the P_2O_5 soly. in 2% citric acid extns. II. The phosphate analysis. *Ibid* 185-94.—A crit. examn. of the molybdenum blue method for the detn. of P_2O_5 in soils, especially 2% citric acid exts. The method is a rapid, simple and cheap way of making P_2O_5 detns. R. M. B.

Available phosphorus of soil resulting from moisture and temperature variations, Big Horn Mountains, Wyoming. T. J. DUNNEWALD. *J. Am. Soc. Agron.* 21, 934-6(1929).—The available P decreases with increase in rainfall. The more highly leached soils near the top of the range at 9000 ft. elevation and with 28 in rainfall show only $\frac{1}{3}$ the amt. of available P that is found in the arid soils at 6,000 ft. elevation near the base of the mountains. The amt. of available P decreases in the lower soil zones of all the profiles as compared with the surface zones where most of the org. matter has accumulated. This is true in the basic and acid soils. E. F. SNYDER

The changes in the solubility of phosphorus pentoxide in the soil of various biological conditions. L. VON KREYBIG. *Z. Pflanzenernähr., Düngung u. Bodenk.* 14A, 240-51(1929).—The application of artificial P_2O_5 manures to acid soils shows very little utilization of the P_2O_5 as long as the level of true biol. activity is low because of a lack of CaO. The results of the Neubauer analyses are of great value in non-acid and slightly acid soils in which the biol. properties of the soil are not significantly affected. The utilization of P_2O_5 fertilizers cannot be realized in an acid soil until the acid conditions are overcome and a favorable biol. condition exists. With slightly acid soils, an application of CaO is necessary in CaO-loving plants to bring about a most favorable condition for the utilization of P_2O_5 fertilizers. A mobilization of the P_2O_5 of alk. soils is realized under favorable biol. conditions, under which conditions the Neubauer values are valuable in recommending a P_2O_5 fertilization. R. M. BARNETTE

The action of water-soluble mono- and diphosphate on permutite, a contribution to the fixation of phosphoric acid by soil constituents. E. BERL AND PH. SCHMITTNER. *Z. angew. Chem.* 42, 351-5(1929).—The possibility of the fixation of H_2O -sol. P_2O_5 by colloidal Al silicate in soils was pointed out and it was shown that permutite as a typical substance for these soil constituents absorbs P_2O_5 out of the H_2O -sol. mono- and diphosphates, as they occur in the usual fertilizer, and out of aq. exts. of the same (superphosphate and nitrophoska). By long treatment of Na permutite with monoalkali-phosphate solns. of increasing concns., products were obtained in which phosphoric acid in the amt. of 1 mol. P_2O_5 and more were combined with fundamental substances with approx. 3.3 mol. SiO_2 and 1 mol. Al_2O_3 , in smaller part as sol. alkali-phosphate and in larger part as insol. Al phosphate. The properties of the products were explained and the conversion was regarded as an example of a topochem. reaction. The P_2O_5 of the products was 95% citrate and 100% citric acid sol. E. F. SNYDER

Sparingly soluble phosphates of physiological importance to plants. E. UNGERER. *Z. Pflanzenernähr. Düngung* 12A, 349-62(1928).—The amt. of H_3PO_4 extd. from the *tert.* phosphates $Mg_3(PO_4)_2 \cdot 22H_2O$, $MgNH_4PO_4 \cdot 6H_2O$, $Ca_3(PO_4)_2$, $AlPO_4$ and $FePO_4$ is affected by the reaction of the extg. soln. and the presence in it of electrolytes and univalent permutites. Neutral salts decrease the soly. of Fe and Al phosphate and increase the pH value of the soln. Clay and K and NH_4 permutites adsorb Ca and Mg ions from the above phosphates, and an equiv. amt. of phosphate appears in soln. In soils, Fe and Al phosphates in the presence of neutral salts are involved in base-exchange activities, and titratable hydrated Al_2O_3 is found in soln. The value of these phosphates as plant nutrients depends on the water and chalk content, and on the reaction

of the soil. When the soil moisture rises to 90% of the max. capacity, AlPO_4 has a greater nutrient value than CaHPO_4 . Soil reactions more acid than $\text{pH } 5$ decrease the nutrient values of Fe and Al phosphate.

B. C. A.

Percolation experiments. I. Nitrification and effect of cover plants. W. N. C. BELGRAVE. *Malayan Agr. J.* 17, 192-205(1929).—Observations are reported on N losses from soils under covers, bare and enriched by N fertilizers.

E. F. SNYDER

The second approximation of the theory of growth factors. E. A. MITSCHERLICH. *Z. Pflanzenernähr. Düngung* 12A, 273-82(1928); cf. C. A. 23, 1711.—The theory of growth factors is extended to include the depression of crop yields resulting from the supply of nutrient in amts. greater than the optimum. Exptl. work can be expressed in math. form. The growth-depression factor is influenced by the nature of the deficient nutrients and of the soil, the buffer capacity and water-retaining capacity of the soil, and by climatic conditions. Much of the exptl. evidence of the opponents of the constancy of the growth factor is considered unsatisfactory because of lack of consideration of the "depression factors."

B. C. A.

The availability of potash in a typical Mauritius soil. N. CRAIG AND R. LINCOLN. *J. Agr. Sci.* 19, 397-403(1929).—The results obtained by Dyer's and Hissink's methods show a fairly close agreement, indicating that for the lateritic soils encountered in Mauritius the former method gives reliable data in so far as K availability is concerned. Application of K salts to these soils results in a gradual increase in the amt. of non-available or non-exchangeable K. When equiv. applications of K_2SO_4 and KNO_3 are made, the increase is greater with the former. When molasses is applied there is a decrease in the amt. of non-available or non-exchangeable K, showing that the K in the molasses has remained in the available or exchangeable forms. The decrease is due to the conversion of the non-available forms pre-existing in the soil into available forms, while the K pre-existing in the soil tends to become more available.

P. R. DAWSON

Studies on the exchangeable potassium. K. BANBERG. *Z. Pflanzenernähr., Düngung u. Bodenk.* 14A, 177-84(1929).—For org. (turf) soils, the bivalent Ca and Mg ions bring into soln. from the org. complex more replaceable K than the univalent Na and NH_4 . In the clay part of the soils more replaceable K was exchanged by NH_4 while the other cations were practically the same. On the basis that the Ca exchanges with replaceable K of humus to a greater extent and NH_4 exchanges with the K of clay to a greater extent, a series of soils was treated with NH_4 and Ca salts to ascertain the different amts. of K in combination with humus and clay. Replaceable K was in combination with clay for the most part. 0.1 N NH_4 acetate soln. was found a suitable means of detg. the replaceable K. In a series of soils with increasing degrees of acidity, the utilization of the replaceable K in Neubauer tests was greatest in the less acid or near neutral soils.

R. M. BARNETTE

The relation between concentrations of potassium in culture solutions and optimum plant growth. R. P. BARTHOLOMEW AND GEORGE JANSSEN. *Soil Sci.* 27, 189-203 (1929).—See C. A. 23, 4497.

E. F. SNYDER

The cobaltinitrite (volumetric) method of estimating potassium in soil extracts. G. MILNE. *J. Agr. Sci.* 19, 541-52(1929).—A volumetric form of the cobaltinitrite method is described. An aliquot of the soln. prepd. for analysis (neutral and free from NH_4 salts and org. matter), representing 5 to 25 mg. K_2O , is evapd. to about 10 cc. Ten cc. each of satd. NaCl and 10% CoCl_2 and 15 cc. of 10% NaNO_3 are added in the order given, mixed, and the mixt. is evapd. to stiff pasty condition or hard dryness. After cooling, 10 cc. of 10% HOAc is run in and the mixt. well stirred to dissolve excess reagents and NaCl. After 15 min. standing, 10 cc. of water is stirred in and the mixt. filtered with suction through a small Gooch crucible, using a disk of No. 40 Whatman paper covered with a layer of the finer particles from a suspension of glass dust in water. The ppt. is washed by decantation with 2.5% Na_2SO_4 , transferred to the crucible and washed 6-8 times with the same wash-liquid. By allowing for an excess of at least 10 cc., a measured quantity of 0.05 N KMnO_4 is dild. and brought to a boil, 10 cc. of dil. H_2SO_4 added, the soln. again boiled and removed from the flame, and the ppt. in its crucible immediately added, stirred around well and the beaker covered and set aside for 10 min. A measured vol. of standard $(\text{COOH})_2$, sufficient to give a clear soln., is added, the crucible removed and the excess titrated with the same 0.05 N KMnO_4 . A complete "blank" analysis should be run for each new set of reagents. The corrected vol. of KMnO_4 is converted to its equiv. of K by the factor 0.000415 g. K_2O per cc. 0.05 N KMnO_4 . This method permits of quantitatively accounting for known amts. of K regardless of the presence of alk. earth sulfate or P_2O_5 , provided that the amt. of K is not varied over too great a range. The factor adapted suits the procedure described over a range of about 3-50 mg. of K_2O . The method is applicable to plant-

ash analyses, regardless of their content of other bases and phosphates or of the mixed sulfate weighed for Na and K together. For small quantity work on soils it is more exact than the perchlorate method. Citric acid exts. can be handled. Some analyses of NH_4Cl exts. were unsatisfactory. Attention is called to the desirability of setting exchangeable K detns. on a firmer analytical basis by investigation of methods of freeing the exts. from NH_4 salts. P. R. DAWSON

The span of p_{H} values in water and potassium chloride solution. S. GOY AND BUROW. *Z. Pflanzenernähr., Düngung u. Bodenk.* **14A**, 348-54(1929).—The difference in the p_{H} value of a soil in aq. suspension and in a KCl soln. gives valuable information concerning the possible injury to plants if the antilogarithmic value (the difference in actual H-ion concn.) is used. The greater the difference of the 2 values the more liable the soil is to be injurious to plant growth. R. M. BARNETTE

The potassium oxide-iron antagonism in the plants as basis of a method for determining the potassium oxide requirements of soils. O. ECKSTEIN AND A. JACOB. *Z. Pflanzenernähr., Düngung u. Bodenk.* **14A**, 205-20(1929).—The method of Hoffer is correlated with the Fe and K_2O content of corn to show that in many instances the accumulation of Fe in the internodes of corn is an indication of an insufficient supply of K_2O for the corn plant. R. M. BARNETTE

Abo-Abo soils respond to potash. PHILIPPINE SUGAR ASSOCIATION STAFF. *Sugar News* **10**, 471 6(1929). V. G. LAVA

Investigational work with fertilizers. FRANK T. SHUTT Canada Dept. Agr., Rept. Dominion Chemist, Year Ending March 31, 1928, 14-33(1929); cf. C. A. **23**, 462. — Applications of Ephos basic phosphate gave as high yields of mangels as equiv. amts. of superphosphate and basic slag. Analyses of limestone, marls, peats, mucks and miscellaneous fertilizer materials are tabulated. A sample of phosphatic waste from a steel plant contained P_2O_5 30.04, BaCO_3 11.58 and acid-insol. matter 2.96%. K. D. J.

The leaching out of autumnal dressings of nitrogenous fertilizers. H. H. NICHOLSON AND BARBARA PANTIN. *J. Agr. Sci.* **19**, 297-301(1929).—The loss, by leaching, of N from CaCN_2 applied in the fall was studied by estn. of nitrate in drainage or leachings from soil treated with it. For comparison, similar studies were made with $(\text{NH}_4)_2\text{SO}_4$ and rape dust. The expts. were conducted in glazed pots with a tubulure at the bottom of the side, set up outdoors so as to receive moisture from rainfall only. A medium loam soil was used. The results indicate that leaching out may occur any time throughout the winter up to March, or rarely April. The loss of nitrate is directly limited by the amt. of drainage and so is indirectly detd. by rainfall, and by temp. which affects the rate of evapn. All three N fertilizers are shown to lose well over 50% of a normal dressing by leaching during the winter. The loss is greatest with $(\text{NH}_4)_2\text{SO}_4$, least with rape dust and intermediate with CaCN_2 . P. R. DAWSON

What quantity of fertilizer to use. A preliminary study of the fertilizer requirement of the red Victorias soils. CARLOS L. LOCSIN. *Sugar News* **10**, 521-33(1929).—L. applied Spillman's yield equation based on the law of diminishing returns to the results of 4 field expts. in Victorias (Negros, P. I.), and found that with a tenant receiving 45% of the sugar at \$4.50 per picul, 450 kg. of ammophos per hectare would be the most profitable quantity of fertilizer to apply. V. G. LAVA

Phosphoric acid gives big increased yields in uplands of La Carlota District. PHILIPPINE SUGAR ASSOCIATION STAFF. *Sugar News* **10**, 452-6(1929).—Phosphoric acid in conjunction with N fertilizers gives a big increase of sugar in the uplands of La Carlota district. Investments in potash are not as yet warranted. V. G. LAVA

The stimulating effect of external applications of copper and manganese on certain chlorotic plants of the Florida Everglades soils. O. C. BRYAN. *J. Am. Soc. Agron.* **21**, 923-33(1929).—Plant responses (cowpeas and sorghum) were almost as good where the Cu and Mn sulfates were applied to the leaves as where they were applied to the soil. Plants on the untreated soil made very little growth, while those on the treated soil made very good growth. Plants grown on the Cu-treated soil contained appreciable quantities of Cu while those on the untreated soil had only traces. Plants receiving Cu and Mn produced mature seed, while the untreated ones failed entirely. The raw peat soils of the Florida Everglades are deficient in available forms of Cu and Mn. E. F. SNYDER

Fertilizing with iodine. F. G. DOERELL. *Z. Pflanzenernähr. Düngung* **12A**, 344-9(1928).—Application of I (as KI) at the rate of 3.2-4.3 kg. per hectare increased the yield of hops, but higher proportions (5.4 kg. per hectare) caused considerable crop reduction. In no case was the increased value of the crop as great as the cost of iodide used. The I present in Chilian saltpeter and in superphosphate is sufficient to show

a small but definite effect in the crop. Iodides improve the color of the hops and decrease the I no. and tannin content. B. C. A.

Some observations on the nitrogenous manuring of grassland. H. W. GARDNER, J. HUNTER SMITH, J. W. REID AND R. H. WILLIAMS. *J. Agr. Sci.* 19, 500-23(1929).—Applications of N equiv. to 400 lb. of $(\text{NH}_4)_2\text{SO}_4$ per acre increased stock-carrying capacity approx. 50% in 1927; in 1928 applications equiv. to 300 lb. $(\text{NH}_4)_2\text{SO}_4$ per acre gave an increase of 20%. The dry matter of the herbage on the N plots contained an av. of 17.7% crude protein as compared with 15.5% where no N was applied.

P. R. DAWSON

The competition between cultivated plants and soil microorganisms for mineral nutrition; action of dried blood on phosphatic fertilizer. D. CHOUGHAK. *Compt. rend.* 189, 262-4(1929).—The expts. offer a new example of antagonism between the higher plants and the soil microorganisms. It is quite probable that this competition for nutrient is produced very often in practice and may extend to the different elements necessary for life: P_2O_5 , K, Ca, Mg and even nitrate. This is the result of too great a disproportion between the different mineral nutritive elements of the soil and the energy-producing elements. As a remedy, one may add fertilizer while observing the necessary proportions between the different elements. E. F. SNYDER

Investigations on yield in cereals. VI. A. A developmental study of the influence of nitrogenous top-dressing on wheat. B. A measurement of the influence of disease ("Take-all") upon the yield of wheat. L. R. DOUGHTY, F. L. JENGLEDOW AND T. K. SANSOM. *J. Agr. Sci.* 19, 472-90(1929).—With winter wheat a late February top-dressing with $(\text{NH}_4)_2\text{SO}_4$ at a rate of 150 lb. per acre did not increase ear-formation. The yield, however, was increased to a rate of 26.4 bu. per acre as compared with 19.1 bu. per acre on the untreated plots. P. R. DAWSON

The relation of sodium nitrate and certain other nitrogen carriers to the development of chlorosis in rice. W. H. METZGER AND GEORGE JANSSEN. *J. Agr. Research* 37, 589-602(1928). NaNO_3 and other nitrates are rapidly reduced in submerged rice soils. The exptl. results indicate that N is lost in the reduction process by denitrification. Ammonification progressed slowly for the first 4 or 5 weeks following submergence, except where an abundance of org. matter was present, and the plants became chlorotic. Chlorosis was overcome as ammonification progressed. NaNO_3 had a slight tendency to hasten the change of the soil reaction toward alk. by flooding, and $(\text{NH}_4)_2\text{SO}_4$ to retard it. Chlorosis became marked in nearly all cases before the soil reaction reached p_{H} 6.0. Where an abundance of org. matter was present in greenhouse soil and in field soil, chlorosis did not appear although the reaction of the soil reached p_{H} 7.0 or slightly above. Spraying FeSO_4 on the leaves of chlorotic plants failed to correct the condition and the addition of ferric citrate to the flood water for this purpose likewise failed. A second application of N while the plants were chlorotic greatly improved their color and vigor. This appears to be good evidence that chlorosis in rice is due to a lack of available N, particularly in the form of NH_3 , rather than to an impaired availability of Fe due to an alk. reaction of the soil. W. H. ROSS

United States insecticide statistics for 1928. R. C. ROARK. *J. Econ. Entomol.* 22, 699-701(1929).—Imports and exports of the principal insecticides are given for 1928, also some information on the production and carry-over of arsenicals. C. H. R.

Insecticides and fungicides. FRANK T. SHUTT. Canada Dept. Agr., *Rept. Dominion Chemist, Year Ending March 31, 1928*, 78-83(1929); cf. C. A. 23, 466.—Injury to apple trees caused by applications of Cu dusts for control of the apple sucker paralleled the degree of infestation by the insects, and was found to be due to the reduction of the Cu compds. by the "honey dew" secreted by the insects. Detns. were made of the amt. of As rendered H_2O -sol. when 14 samples of *Paris green* were digested for 24 hrs. with (1) previously boiled distd. H_2O at a const. temp. of 32° , (2) previously boiled distd. H_2O at $23-25^\circ$, and (3) distd. H_2O , not previously boiled, at $23-25^\circ$. In all cases the largest amts. of sol. As were obtained by (1) and the smallest by (2). Efficient spreading of waste crankcase oil on water was obtained by adding up to 1% of a more volatile oil such as crude cresylic acid or tar acid oil. K. D. JACOB

Some limiting factors in the use of saturated petroleum oils as insecticides. HUGH KNIGHT, JOSEPH C. CHAMBERLIN AND CHAS. D. SAMUELS. *Plant Physiology* 4, 299-321(1929).—The bad effects frequently observed on fruit trees from the use of satd. petroleum oils are due to phys. rather than to chem. handicaps caused by the penetration of the oil into the plant tissue. By means of a special staining technic, which is described in detail, it was noted that beginning within a few days after entrance into the intercellular spaces of citrus and extending over a period of many months in a satd. petroleum oil of 106 seconds viscosity, the oil is taken into the vascular system of the

plant and translocated to the storage tissues. Conclusion: Heavy white oils (of a viscosity exceeding 60 seconds *Sayboldt*) must be used sparingly and with a great degree of caution, if, in the future, serious ultimate injury is to be avoided. W. T.

Pyrethrin I and II. Their insecticidal value and estimation in pyrethrum (*Chrysanthemum cinerariaefolium*). F. TATTERSFIELD AND R. P. HOBSON. *J. Agr. Sci.* 19, 266-96(1929).—Pyrethrin I and II were isolated by the method of Staudinger and Ruzicka (*C. A.* 18, 1818-20). Both are highly toxic to *Aphis rumicis*. Pyrethrin I was found to be the most toxic substance so far tested, being about 10 times as toxic to these insects as pyrethrin II. It is probably mainly responsible for the contact insecticidal value of pyrethrum. Two microanalytical methods of detg. pyrethrin content based on macro methods of Staudinger and Harder (*Ann. acad. sci. Fennicae*, A, 29, No. 18 [1927]) are described: (a) by means of the acids after hydrolysis and (b) by means of the semicarbazone. The analytical results obtained for a series of pyrethrum samples agreed with their observed insecticidal properties to *A. rumicis*. Comparisons of the pyrethrin contents as estd., with the results of direct toxicity expts. both on the pyrethrum samples and the pure pyrethrins, confirm the validity of the analytical methods. There was a significant and positive correlation, in the samples tested, between the amts. of pyrethrin I and II. Insufficient data are available to show a significant correlation between the size of flower heads and the content of poison, or to draw conclusions as to the effect of external conditions such as soil, weather or age of bed. P. R. DAWSON

Pyrethrin I and II. Their estimation in pyrethrum (*Chrysanthemum cinerariaefolium*). F. TATTERSFIELD AND R. P. HOBSON. *J. Agr. Sci.* 19, 433-7(1929); cf. preceding abstr.—The acid method previously described has been used to evaluate samples of pyrethrum derived from both Swiss and Japanese seed, with equally successful results. A modification of the acid method providing a rapid assay of pyrethrum by detn. of pyrethrin I is described in detail. P. R. DAWSON

Activity of pyrethrum powders. GIOVANNI ISSOGGIO. *Ann. Schiapparelli* 3, No. 5, 10-2(1929).—Samples of pyrethrum from Dalmatia (*Chrysanthemum cinerariaefolium*) and from Caucasus (*Pyrethrum roseum*) contained, resp.: moisture 10.15, 11.72; ash 7.04, 8.44; Et₂O ext. 5.15, 5.75; alc. ext. 19.14, 18.00; tannin (Lowenthal's method) 4.44, 4.38%. The activity is detd. by placing in an 18 × 2-cm. glass tube 0.5 g. powder and some insects. Fleas, bugs, ants and beetles are paralyzed within 1/4-1/2 hr., flies within 1/2-3/4 hr. When the material is sophisticated, these times are longer. G. A. BRAVO

Evolution of hydrocyanic acid from calcium cyanide. H. D. YOUNG. *Ind. Eng. Chem.* 21, 861-3(1929).—With any given Ca(CN)₂ the rate of evolution of HCN increases with increasing relative humidity. With a calcium cyanide, 80% of which passes through a 200-mesh sieve, commercially satisfactory evolution of HCN (90% more) will occur in about 2 hrs. with a relative humidity of 50% or more. E. F. S.

The fungicidal properties of certain spray-fluids. V. W. GOODWIN, H. MARTIN AND E. S. SALMON. *J. Agr. Sci.* 19, 405-12(1929).—A soln. of di-Ca-H arsenate at a strength of 0.0125% As₂O₅ was fungicidal to the conidial stage of *Sphaerotheca humuli*, while at 0.006% As₂O₅ it was not quite fungicidal. Lime casein contg. Ca(OH)₂, when added as a spreader to Ca arsenate, reduced the fungicidal properties of the Ca arsenate spray. A soln. of Ca thioarsenate at a strength equiv. to 0.006% As₂O₅ was fungicidal to *S. humuli*, while at 0.003% As₂O₅ it was below fungicidal strength. It is suggested that the increased fungicidal properties of the mixed lime sulfur-lead arsenate spray are due to the presence of Ca thioarsenate. P. R. DAWSON

Facilitating the removal of the spray residue. R. H. ROBINSON. *J. Econ. Entomol.* 22, 693-8(1929).—This is a lab. study of the removal of PbHAsO₄ spray residues from apples. Settling of dust on the residue in the calyx and stem ends of apples increases the difficulty of removal. Any compd. or substance that is insol. or slightly sol. in water facilitates the removal of PbHAsO₄ residue by the HCl treatment. From 1 to 2 lb. Ca(OH)₂ per 100 gal. PbHAsO₄ spray mixt. should materially aid in the removal of the residue. C. H. RICHARDSON

Spraying for the control of onion thrips in Massachusetts. A. I. BOURNE. *J. Econ. Entomol.* 22, 679-83(1929).—The onion thrips (*Thrips tabaci*) is not effectively controlled by dusts. Nicotine sulfate in soln. with K fish oil soap has given excellent results. Although toxic to the insects, oil sprays do not adequately cover the plant surfaces. A power sprayer for com. onion spraying is described. C. H. RICHARDSON

Hydrated lime in summer sprays for the control of the oriental fruit moth. A preliminary report. L. A. STEARNS AND R. B. NEISWANDER. *J. Econ. Entomol.* 22, 657-60(1929).—Heavy applications (10-25 lb. to 50 gal. water) of Ca(OH)₂ with or

without other insecticides gave promising control of the oriental fruit (peach) moth (*Laspeyresia molesta*). The coating of $\text{Ca}(\text{OH})_2$ acts as a phys. and mech. hindrance to oviposition, hatching and entrance of larvae into twig and fruit. Results of practical expts. are given. C. H. RICHARDSON

Miscellaneous codling moth studies. L. F. STEINER. *J. Econ. Entomol.* 22, 648-54 (1929).—Bands treated with β -naphthol killed 97% of the larvae of *Carpocapsa pomonella*, captured and repelled 10-20% of the larvae. α -Naphthylamine appears to be as effective as β -naphthol. Biol. data on the larvae are also included. C. H. RICHARDSON

Banding for codling moth control. W. P. FLINT AND C. C. GOFF. *J. Econ. Entomol.* 22, 675-9 (1929).—Chemically treated bands of various types of fabric were used to capture and kill codling moth larvae (*Carpocapsa pomonella*). *o*-Toluidine, monochloronaphthalene, β -naphthol, *o*-dichlorobenzene, petroleum lubricating oil emulsion and Na_2SiF_6 were used in various mixts. Mixts. of 1 part monochloronaphthalene or 1 part *o*-toluidine in 10 parts lubricating oil gave the best results. When these materials were used on crepe paper bands, severe injury resulted within 5 months. β -Naphthol in lubricating oil was less injurious to the tree. C. H. RICHARDSON

Codling moth bait trap studies. L. F. STEINER. *J. Econ. Entomol.* 22, 636-48 (1929).—A large no. of baits contg. fermenting carbohydrate material, fruits and fruit juices and a no. of esters and other org. compds. in various mixts. were tested as attractants for the adult codling moth (*Carpocapsa pomonella*). A low-grade molasses in aq. soln. contg. geraniol was most attractive. Pure chem. compds. used alone were of no value. The use of bait traps was uneconomical in orchards where the codling moth injury was held to less than 10% by other means. Methods of trapping are discussed. C. H. RICHARDSON

A determination of the lethal dosage of arsenic for Missouri and Colorado codling moth larvae. LEONARD HASEMAN AND VIRGIL F. BURK. *J. Econ. Entomol.* 22, 655-6 (1929).—Known amts. of As_2O_3 in aq. soln. were fed to larvae of *Carpocapsa pomonella* from Colorado and Missouri to det. whether the Colorado individuals were more resistant to As than the Missouri individuals. The results do not support Hough's contention (C. A. 2634) that the Colorado larvae are more resistant than larvae from localities farther east. C. H. RICHARDSON

Attempts to protect sweet corn from infestations of the corn-ear worm, *Heliothis obsoleta* (Fabr.). STANLEY B. FREEBORN AND FLOYD H. WYMORE. *J. Econ. Entomol.* 22, 666-71 (1929).— Na_2SiF_6 , extra light, 70-75%, and pyrethrum ext. were the most effective insecticides tried against the corn-ear worm; black pepper proved to be the most satisfactory repellent for the adult moth. C. H. RICHARDSON

Observations on the carrot rust fly (*Psila rosae* Fab.) in Massachusetts. W. D. WHITCOMB. *J. Econ. Entomol.* 22, 672-5 (1929).—Preliminary expts. with derris powder and exts., HgCl_2 and Na_2SiF_6 were promising. The paper also contains life-history information. C. H. RICHARDSON

High-nicotine tobacco. R. C. COLLISON, J. D. HARLAN AND L. R. STREETER. N. Y. State Agr. Expt. Sta., *Bull.* 562, 19 pp. (1929).—Expts. on the growing of high-nicotine tobacco in N. Y. for insect control are described. *Nicotina rustica* and certain varieties of *N. tabacum* were used. Variability in yield is discussed. From 100 to 150 lb. nicotine per acre was obtained. The impracticability of growing nicotine on the av. farm for spray purposes is stressed. C. H. RICHARDSON

The onion maggot situation in New York. HUGH GLASGOW AND HAROLD T. COOK. *J. Econ. Entomol.* 22, 683-8 (1929).—Petroleum lubricating oil emulsion contg. Bordeaux mixt. is the most efficient spray for the onion maggot (*Hyalemyia antiqua*). Practical control measures are discussed. C. H. RICHARDSON

Combating the grain beetle (*Calandra granaria*). KURT SEIDL. *Z. ges. Getreidew.* 15, 35-44, 61-9; *Chem. Zentr.* 1928, II, 284.—The following substances were used in lab. tests: H_2S , AsH_3 , CS_2 , CCl_4 , SO_2 , NO_2 , Et_2O , CH_3O , MeOH + CH_3O , HCO_2Me , AcOEt , Cl , HCN , O_2 , N_2 , H_2 , CO , CO_2 and a mixt. of aniline and clove oils with xylene. HCN , CS_2 , AsH_3 , CCl_4 , H_2S , HCO_2Me and EtOAc gave the most promising results. The use of heat or vacuum is not economically feasible. C. R. FELLERS

The downy mildew of the hop in 1928. E. S. SALMON AND W. M. WARE. *J. Inst. Brewing* 35, 20-5 (1929).—In 1928 downy mildew seriously attacked the tips of trained-up vines, resulting in a diminished crop and early picking, which injured brewing value. Spraying with Bordeaux mixt. was tried out and it was found that a fine misty spray was needed to avoid "scorching" of the growing leaves. PETER J. F. WEBER

Chemical treatment to shorten the rest period of sugar-maple trees. C. G. DEUBER AND P. R. BOWEN. *Science* 70, 102 (1929).—Ethylene chlorohydrin is used for forcing

woody plants in the study of a fungus disease. Its effects on the host leaves are described. E. F. SNYDER

Experiments on the eradication of Canada thistle, *Cirsium arvense*, with chlorates and other herbicides. ALFRED ÅSLANDER. *J. Agr. Research* 36, 915-34 (1928).—A late autumn application of 200 kg. of NaClO_3 , or 250 kg. of KClO_3 , per hectare killed the roots of Canada thistle during the winter, without injury to oats that were sown on the plots the following spring. An early spring application was less effective. Other herbicides tested had practically no effect. The effectiveness of chlorates is due to their rapid penetration through soil and to their slow decompn., especially at low temps. NaCNS and to a greater extent NaCN decompose so rapidly in the soil that no harm is done to the thistle under field conditions. NaHAsO_3 is ineffective because it penetrates the soil very slowly. A special app. was developed for detg. the rate at which the herbicides penetrate the soil. An application of herbicides in the autumn has no influence on the ammonification and nitrification processes in the soil the following spring. W. H. ROSS

Results at the Pasadena activated-sludge plant (HATCH) 14. The analysis of tomato plants [to determine role of phosphates] (OWEN) 11D. Spectrographic chemical analysis [of Rb in soils and plant ashes] (RAMAGE) 7. S-spray residues and the swelling of tin cans packed with peaches (CULPEPPER, MOON) 12. Mineralogy of soils. I. The exchange reaction of insoluble alkaline earth phosphates with permutites and clay (UNGERER) 6. Nature of the nitrogenous compounds in fungous tissue and their decomposition in the soil (HECK) 11D. Pyrethrum flowers [as insecticides] (GNADINGER, CORI) 17.

Tree paint. WALTER G. CORNELIUS. U. S. 1,730,724, Oct. 8. Gilsonite 50 lb., rosin 10 lb., coal tar 10 gal. and gasoline 4 gal.

16—THE FERMENTATION INDUSTRIES

C. N. FREY

Alcoholic fermentation of the amino acids. E. PARISI. *Ann. chim. applicata* 19, 234-9 (1929).—Amino acids occurring in molasses contribute little toward the alc. formed during its fermentation. In solns. contg. 100 mg. of amino N_2 per 100 cc. glycocoll, *d*-alanine, *d*-valine, asparagine, *l*- and *dl*-leucine, *d*- and *dl*-isoleucine, phenyl- α -alanine, phenyl- β -alanine and tryptophan showed consumption of N_2 varying from 20 mg. (tryptophan) to only 2 mg. (phenyl- β -alanine). Therefore, these compds. cannot at present be used as a cheap source of higher ales. A. W. CONTIERI

The noxiousness of methanol formed during alcoholic fermentation. O. WINDHAUSEN. *Naturwissenschaften* 17, 631-4 (1929).—A review. MeOH contents of various natural beverages are given, with references. In certain brandy species as much as 3.2 to 4% of the alc. occurs as MeOH . B. J. C. VAN DER HORVEN

The fermentometer. OTTO RAHN. *J. Bact.* 18, 199-205 (1929). J. T. M.
A new method of making unfermentable cider. S. C. VANDECAVEYE. *Zentr. Bakt. Parasitenk.*, II Abt., 78, 66-74 (1929).—Unfermentable cider can be made by 3 successive inoculations with yeast and the addn. of 0.04% of Na benzoate. The addn. of NH_4 molybdate, Al cream and $\text{Pb}(\text{OAc})_2$ singly or in combination, but not exceeding 0.1%, altered the flavor and was not effective in pptg. P. The addn. of colloids such as agar or silicic acids, of CaCl_2 or of NaCl , singly or combined in 0.1% concn. to cider subjected to 3 successive inoculations with yeast, did not alter the flavor and did not remove any N or P. JOHN T. MYERS

Rapid method for the determination of the dry extract in vinegars. GUIDO DONA. *Giorn. chim. ind. applicata* 11, 264-5 (1929).—The vinegar to be examd. is evapd. to $\frac{1}{2}$ its original vol., and diluted to its original vol. with distd. H_2O . The acidity is detd. Then an AcOH soln. in pure H_2O equal in vol. and titer to the above is prepd. A special hydrometer is then immersed in the AcOH soln. and its scale moved so that its zero pt. is at the liquid meniscus. It is then immersed in the vinegar soln. and the reading taken, the hydrometer having previously been standardized against solns. with known dry ext.

The aims of barley research. H. LLOYD HIND. *J. Inst. Brewing* 35, 69-75 (1929).—The Institute of Brewing Research is directed toward larger yields of best

brewing barley, what constitutes quality in barley, and the changes the barley undergoes in the malting and brewing processes.

The malting barleys of 1928. JAMES STEWART. *J. Inst. Brewing* 35, 116-29 (1929).—Barleys appear to be generally low in N and diastase. Some observations are given on foreign barleys.

Some practical advantages to be derived from the neutralization of brewing liquor. D. McCANDLISH AND G. HAGUES. *J. Inst. Brewing* 35, 61-6 (1929).—A diagram and description are given of an app. for treating the water used in brewing with H_2SO_4 , to bring the water to p_H 7.0. Several years' use of the app. has improved yeast flocculation and the yeast is free from contaminating organisms, although through 200 brews. Before neutralization of the water was practiced, the yeast had to be treated with tartaric acid every 20-30 brews to suppress bacterial infection.

Animal feeding and brewery by-products. C. HEIGHAM. *J. Inst. Brewing* 35, 104-8 (1929).—The brewery by-products wet grains, dried grains, malt culms, dried yeast and spent hops are compared with other feeds in their class, as to dry matter, digestible crude protein, starch equivalent and price.

Inversion method for determining the hydrogen-ion concentration in wine. GEORG AGABALIANZ. *Biochem. Z.* 211, 373-7 (1929).—An improved thermostat for carrying out the H-ion concn. detn. on wine by following the velocity of inversion of a 10% sucrose soln. at 76°. The invertase is inactivated by preliminary heating to 90°. The inversion const. [$K = (\log C_0 - \log C_t)/0.4343.t$] gives accurate information as to the H-ion concn.

The continuous pasteurization of black beers. R. SELIGMAN. *J. Inst. Brewing* 35, 10-7 (1929).

Conditions for the aeration of fermenting vats in the yeast industry or for the aeration of liquids in general. E. G. STICH. *Chem.-Ztg.* 52, 865-6 (1928).—The efficient aeration of liquids is discussed. Important factors are the ratio of the total area of the air passages in the aeration app. to that of the vat floor, and also of the total surface area of the bubbles to the required air content of the liquid.

The nourishment of compressed yeast with inorganic ammonium compounds. WERNER STACH. *Z. angew. Chem.* 42, 842-3 (1929).—A criticism of an article by Claassen (*C. A.* 23, 1210). Reply. H. CLAASSEN. *Ibid* 843.

The cleavage of glycylglycine, alanylglycine and leucylglycine by intestinal and malt peptidases (LINDERSTRØM-LANG, SATO) 11A. Production of absolute alcohol from sulite spirit (KIRMKEUTHER) 23.

Cooling worts during alcoholic fermentation. FRANK E. LICHTENTHAELER. U. S. 1,731,073, Oct. 8. CO_2 evolved during fermentation is drawn off, compressed, cooled and reintroduced.

Denaturing ethyl alcohol. JOHN W. ORELUP, ERNST OHLSSON and SAMUEL ISERMANN. U. S. 1,730,850, Oct. 8. *o*- and *p*-Chlorophenol or other suitable halogen substituent of phenol is used as a denaturant.

Yeast. WILHELM H. F. BÜHRIG (to The Fleischmann Co.). U. S. 1,730,876, Oct. 8. In a "continuous-addn.-withdrawal" process of yeast manuf. yeast is propagated with aeration in a main fermenter while a yeast nutrient soln. is added slowly and substantially continuously, and yeast-contg. soln. is withdrawn at such a rate as approx. equals that of the addn.; the yeast-contg. soln. is conducted to an auxiliary fermenter and propagation of the yeast in the soln. is continued in the auxiliary fermenter with aeration for a period of time after it leaves the main fermenter, and the yeast-contg. liquid is then withdrawn from the auxiliary fermenter and the yeast is sepd. Various preferred and advantageous details of procedure are described. Cf. *C. A.* 22, 3017.

17—PHARMACEUTICAL CHEMISTRY

W. O. EMERY

Determination of phosphorus in Tonophosphan. ANON. *Prog. terap.-Ses. farm.* 17, 50-2 (1928).—In Tonophosphan (Bayer) $Me(Me_2N)C_4H_2PO_3HNa$, P can be detd. by dissolving 0.5 g. sample in 5 cc. water in a Kjeldahl flask, adding 0.5 g. KOH, 20 cc. H_2O_2 (15%) and a few crystals of $Fe(NO_3)_3$, concg. the soln., boiling gently and adding 20 cc. H_2O_2 and 10 cc. HNO_3 (d. 1.4), repeating the concn. and addn. of H_2O_2 , and in the finally concd. soln. detg. phosphoric acid by the NH_4 molybdate method. G. A. B.

Determination of antipyrine in antineuralgic preparations. ANON. *Prog. terap.-Sez. farm.* 18, 12-3(1929).—To 20 cc. of soln. contg. about 0.2% antipyrine (a preliminary test is necessary) add 20 cc. of 2.5% HgCl_2 . Titrate the soln. with alc. 1.35% I soln. until a persistent yellowish color is reached. Titrate the I soln. every time with a standard (1%) pure antipyrine soln. G. A. BRAVO

Solutions of quinine in ethyl urethan. M. GIORDANI. *Ann. chim. applicata* 18, 479-85(1928).—Spectroscopic studies confirmed the conclusion (cf. *C. A.* 22, 4173) that the presence of ethyl urethan in solns. of quinine-HCl accelerates the isomerization of quinine to quinotoxine. A. W. CONTIERI

The thiocyanate number of strophanthus oil and of oils of the chaulmoogra group. E. I. VAN ITALLIE. *Pharm. Weekblad* 66, 677-83(1929).—The SCN ion adds only to 1 of the 2 double bonds in unsatd. acids of the linoleic series, and a comparison of the SCN no. with the I no. makes it possible to calc. the proportions of doubly unsatd., singly unsatd. and satd. acid present in a fat (cf. Kaufmann, *C. A.* 20, 2989). By this method 2 samples of strophanthus oil were estd. to contain 25.2, 26.6% satd. acids, 44.3, 48.1% oleic acid, and 30.5, 25.3% linoleic acid. Chaulmoogra oil and hydnocarpus oil, however, gave I nos. of 100.6 and 95.7, resp., and SCN nos. of 99.1 and 94.8, resp. The close agreement here between I no. and SCN no. precludes the possibility of the presence of more than a trace of any acid of the linoleic series. Similarly, the I no. of gorli oil obtained from seeds of the African tree *Oncoba echinata*, which was formerly believed to contain 10-2% of a highly unsatd. acid, was found to be identical with the SCN no., viz., 93.4 and 93.2, resp., and the absence of linoleic acid was thus demonstrated. A. W. DOX

Microchemical reactions for nicotine. M. WAGENAAR. *Pharm. Weekblad* 66, 773-6(1929).—The lowest concn. and the min. quantity of alkaloid that can be detected by various reactions are: HgCl_2 , 1:100, 0.00001 g.; $\text{KI} + \text{HgI}_2$, 1:500, 0.000002 g.; CdI_2 , 1:1000, 0.000001 g.; CdBr_2 , 1:400, 0.000005 g.; CdCl_2 , 1:100, 0.00002 g.; $\text{Zn}(\text{SCN})_2$, 1:100, 0.00002; $\text{Co}(\text{SCN})_2$, 1:100, 0.00002 g.; PtCl_4 , 1:500, 0.000002; AuCl_3 , 1:500, 0.000002 g.; I in KI, 1:100, 0.00001 g.; picric acid, 1:1000, 0.000001 g.; picrolonic acid, 1:100, 0.000005 g. A. W. DOX

Microchemical reaction for sparteine. M. WAGENAAR. *Pharm. Weekblad* 66, 809-12(1929).—The sensitivity of various pptn. reactions in terms of min. concn. and min. quantity of alkaloid detectable is: CdI_2 , 1:1000, 0.001 mg.; ZnI_2 , 1:1000, 0.001 mg.; SnI_2 , 1:100, 0.01 mg.; AuCl_3 , 1:1000, 0.0005 mg.; $\text{K}_4\text{Fe}(\text{CN})_6$, 1:200, 0.01 mg.; $\text{K}_3\text{Fe}(\text{CN})_6$, 1:200, 0.01 mg.; $\text{KI} + \text{I}$, 1:200, 0.01 mg. A. W. DOX

Rapid determination of ethereal oils in alcoholic solutions. G. ROSENBERGER. *Parfümeur* 3, 78-81(1929).—R. shakes 25 g. of the alc. soln. in a 150 cc. separatory funnel with 25 cc. of a 15% NaCl soln. and 45 cc. petr. ether (sp. gr. 0.63, b. p. below 40°); he distills the aq. salt soln. for the alc. detn. and the petr. ether soln. for essential oils, using Hartel-Witt's method and app. (*C. A.* 2, 1306). P. ESCHER

A new variety of wormwood from the lower Volga which has l-camphor as the principal ingredient of its essential oil. A. RICHTER, L. KASAKEVICH, O. SOBOLEVSKII AND K. SUCHORUKOV. *J. expl. Landwirtschaft Sudosten Europ.-Russlands* 4, No. 2, 10 pp., sep. (1927); *Chem. Zentr.* 1928, II, 193.—A species of *Artemisia* from Astrachan contained 90.87% l-camphor and possessed valuable therapeutic properties. C. R. FELLERS

Detection of isopropyl alcohol in cosmetics by piperonal. G. REIF. *Z. Untersuch. Lebensm.* 57, 277-88(1929).—The alc. distillate from 10 cc. of the sample is cooled in ice water, 1 cc. is added to 3 cc. of an aq. soln. of $\text{HONH}_2 \cdot \text{HCl}$ (0.05 g. for mouth washes and perfumes and 0.1 g. for hair washes), the mixt. shaken, and after 3 min. again shaken with 0.4 g. of animal charcoal and filtered. Five cc. of a 0.5% soln. of piperonal in abs. EtOH, and then 20 cc. of H_2SO_4 are slowly added to the filtrate. In the absence of isopropyl alc. a brown or green-brown color appears, or in its presence a red or red-brown color. If 30 cc. of a 30% soln. of AcOH is at once added, a grayish yellow or transitory red color is obtained in the presence of the alc., or a red-brown color turning red after 10 min. appears in its presence. The method was tested for a no. of cosmetics of known and varied compns., and shown to be independent of the presence of fusel oil, denaturants or other constituents. C. R. FELLERS

Phytomicrochemical tests as pharmacopeial identity tests. E. H. WIRTH AND J. A. DORJAHN. *Am. J. Pharm.* 101, 638-49(1929).—A discussion and preliminary report of certain reliable tests which the authors considered of exceptional value and recommended for the inclusion in the pharmacopeial monographs and also in the National Formulary. Tests are divided into 2 groups: (1) those that depend upon the crystn. of the active constituent, or the identification of the active constituent by the

prepn. of a cryst. compd. by org. chem. reaction, and (2) those where the identity of the isolated constituent is detd. by color reactions. Tests of the following drugs are described: Group I (microcrystn.) cinnamomum, caryophyllus; (microextrn. on a slide) piper, opium, cinchona, myristica and hydrastis; (microsublimation) uva ursi, rheum, cantharis, etc. Group II (color reactions) ipecacuanha, nux vomica, colchicum, hyoscyamus, belladonna and stramonium. Twelve photomicrographs are shown.

W. G. GÄSSLER

The natural chemical resources of Australia plant products. I. A. R. PENFOLD. *J. Chem. Education* 6, 1195-1205(1929).—Australia is especially rich in essential oil-yielding plants, *Eucalyptus* forming 75% of the vegetation. E. H.

The methods of denicotinizing. HANS RUNDSHAGEN. *Chem.-Ztg.* 53, 717-8 (1929).—The extrn. of tobacco with solvents is not satisfactory, as nicotine salts are insol. in most of the solvents, while the aromatic substances are sol. Treatment with alkali destroys the structure of the leaves and the aromatic substances. Direct evapn. of the nicotine has little effect, as its salts are not volatile. Only traces of free nicotine are present in the leaf. If moist leaves are stored in a compact layer, a fermentation occurs, the temp. rises to 60° and NH_3 , HNO_3 , CO_2 and low fatty acids are formed. In a sample, the nicotine content dropped from 1.75 to 0.05%. A study of the biol. conditions of the bacteria of tobacco fermentation is recommended. A. E. M.

Fluidextract of *Frangula*. CHR. SCHOUSEN. *Dansk. Tids. Farm.* 3, 209-22 (1929).—S. discusses the methods for extg. the active principle of *Frangula* as recommended by different pharmacopoeias. The relative solubilities of the different compds. found in this plant in water, alc., etc., are also considered. A method of analysis is also discussed. Percolating with a 4 to 1 alc.-water mixt. yielded a fluidext. contg. the active principle of *Frangula*. The results agree well with those of Aweng who used 80-90% alc. soln. for extrn. O. A. NELSON

Titration of some mercury preparations used in pharmacy. ALFRED WÖHLK. *Dansk. Tids. Farm.* 3, 225-44(1929).—Numerous methods for the detn. of Hg compds. are discussed. For HgCl_2 : To 20 cc. HgCl_2 soln. (not less than 1%), add 0.5-1.0 cc. H_2O_2 (3%), 5 cc. dil. H_2SO_4 and 3-5 cc. starch soln. With const. shaking add 0.1 N KI soln. until the red HgI_2 changes over to a brick red. The color of the soln. now becomes faintly blue. Back titration cannot be done, although one can add a drop of $\text{Na}_2\text{S}_2\text{O}_3$ soln., whereby the color again turns brick red; thus it is ascertained that an end point is reached. For HgO : Dissolve HgO in about 10 times its weight of $\text{Na}_2\text{S}_2\text{O}_3$ soln. The temp. must not rise over 35-38°. Two mols. NaOH are liberated per 1 mol. HgO . Titrate with 0.1 N acid. For calomel: $\text{Na}_2\text{S}_2\text{O}_3$ ppts. Hg from HgCl_2 . Carefully wash the gray Hg and then shake with 0.1 N I_2 soln. Titrate the excess I_2 soln. with $\text{Na}_2\text{S}_2\text{O}_3$. HgCN , $\text{Hg}(\text{CN})_2$, and Hg salves are also considered. O. A. N.

Birch oil. R. HUERRE. *Cuir tech.* 18, 231-2(1929).—Samples of birch oil obtained differed widely. Birch oil made from bark in the lab. had an almost const. compn. A yield of 7-8.4% based upon the wt. of the bark was obtained. At atm. pressure 4% of the birch oil distd. over at less than 100°, 38% from 100° to 150°, 15% from 150° to 250° and 14% from 250° to 300°. Further heating caused decompn. The sp. gr. was 0.985. J. G. NIEDERCORN

A new essential oil containing geraniol. B. N. RUTOVSKII AND N. MAKAROVA-SEMLYANSKA. *Riechstoffind.* 3, 140, 161(1928); *Chimie & industrie* 22, 323.—The yield of oil obtained by steam distn. of *Laserpitium hispidum* MB, harvested in Crimea, varied from 0.18 to 0.77% according to the part of the plant that was distd. and to its dryness. Samples taken periodically during the distn. showed that the content of alcs. progressively increased. The oil contains monocyclic and aliphatic terpenes, which could not be identified, and 40-2% geraniol. A. PAPINEAU-COUTURE

Cod-liver oil with ferrous iodide. V. ZANOTTI. *Boll. chim.-farm.* 48, 543-4 (1929); cf. Siboni, C. A. 23, 3542.—A formula is given for the prepn. of cod-liver oil contg. Fe and I. G. SCHWOCH

Medicinal plants and the Italian Pharmacopeia. C. B. INVERNI. *Giorn. farm. chim.* 78, 355-6, 359-60, 363-4, 367-8(1929). G. SCHWOCH

Presence of *l*-asparagine in the fresh flowers of *Ulex europaeus* L. M. BRIDEL. *J. pharm. chim.* [8], 9, 112-3(1929).—See C. A. 23, 4719. S. WALDBOTT

Study of the complex digitonin-ergosterol. H. PÉNAU AND (MLLE.) Z. HARDY. *J. pharm. chim.* [8], 9, 145-51(1929).—For complete pptn. of ergosterol (A) by means of soln. of digitonin (B), dissolve 175 mg. of A in 99% warm EtOH, cool and bring the vol. to 100 cc. at 15°. Also prep. a 1% soln. of B in 99% EtOH at 15°. Then put into a dry and tared centrifuge tube 10 cc. of soln. A at 15°, 9 cc. of soln. B at 15° and 2 cc. H_2O . Mix well with a glass rod, then rinse it with 5-6 drops of 99% EtOH, and

allow the mixt. to stand at 18° for 18 hrs. Centrifuge for 15 min., decant the liquid from the ppt., wash the latter with 4 cc. of Caminade's solvent (C. A. 17, 1257), then mix it with 3 cc. of the same solvent, rinse the rod with 1 cc. of solvent, again centrifuge, decant and put the tube with the ppt. into a vacuum over P_2O_5 to const. wt., i. e., for 18 to 24 hrs. From 0.0175 g. A, 0.07 g. (± 0.5 mg.) of the complex was obtained, i. e., 1 g. of the complex contains an av. of 0.250 g. A. S. WALDBOTT

Detection of carbon tetrachloride in chloroform. J. SIVADJIAN. *J. pharm. chim.* [8], 9, 434-7(1929).—Shake 1 g. of the suspected $CHCl_3$ with 250 cc. of a satd. aq. soln. of CCl_4 ; any insol. liquid residue indicates the presence of at least 5% of CCl_4 in $CHCl_3$. This test is a proposed correction of the faulty test of the French Codex. A new color test (cf. C. A. 17, 2575; 19, 649) is as follows: Into about 5 cc. of an alc. 1% soln. of pyrocatechol pour 2 cc. $CHCl_3$, and 0.5 cc. NaOH carefully as a substratum. Add a pinch of powd. Cu, rapidly bring to boiling and maintain this for 8-10 sec. Cool rapidly, add 1 cc. concd. HCl and 1 cc. H_2O , agitate, then decant and filter about half the vol. When the $CHCl_3$ contains 0.25% CCl_4 or less, the liquid will be straw-yellow to brown-yellow; with 0.25-0.50% CCl_4 an orange-yellow, above 0.50% a more or less dark purple red color is obtained. Pure $CHCl_3$ does not produce any color in this test. $CHCl_3$ for anesthetic purposes should not contain more than 0.25% CCl_4 . S. WALDBOTT

Preparation of gentianose from gentian root dried in air without fermentation. M. BRIDEL AND (Mlle) M. DESMAREST. *J. pharm. chim.* [8], 9, 465-79(1929).—The process of rapid percolation (C. A. 22, 3019) is applied to powd. gentian previously dried in air without fermentation, and rich in gentianose (A) (24%). Cold percolation with 90% alc. (collecting 10 vols. of percolate) extd 95.95% of A present; percolation with 95% alc. (collecting 20 vols.) extd. 36.5%, although A is but feebly sol. in 90% and nearly insol. in 95% alc. The solns. obtained are supersatd. and soon ppt. A in crystd. form. This behavior is probably caused by the presence in the root of some unstable complex more sol. in alc. than A itself. By means of this process, 50 g. of A per kg. of powd. dried root may be easily extd. The results also confirm the preservation of immediate principles in the fresh root through proper drying as advocated by Bourquelot and B. (C. A. 4, 2977). A list of 12 references is added. S. W.

Chemical composition of the root of Geum urbanum L. J. CHEYMOL. *Schweiz. Apoth.-Ztg.* 66, 283-4(1928); *Thesis*, Paris, 1927; cf. C. A. 19, 1442; 20, 435; 21, 1126. —A study of geoside and gease. On drying the root, the geoside upon hydrolysis disappears completely, as the resulting eugenol (A) evaps. C. det. A by oxidation with $FeCl_3$, insol. dehydrodieugenol being formed (cf. C. A. 2, 2825, 3349). Good results are obtained with quantities of A above 0.1-0.02 g. Certain allied plants in which gease occurs are enumerated. S. WALDBOTT

Color reaction differentiating between sodium benzoate from synthetic benzoic acid and that made from gum benzoin. A. B. *Schweiz. Apoth.-Ztg.* 67, 110(1929).—Pharm. Helv. requires the $BzOH$ for this salt to be derived from the gum. Dissolve 0.15 g. of the salt in 15 cc. H_2O , add 10 drops HCl and shake; flaky $BzOH$ ppts. Add 10 drops $K_2Cr_2O_7$ and later 5 drops $FeCl_3$. When the reaction has ceased, add 5 drops dil. HCl and 5 drops H_2O_2 . A blue color is seen, changing to green, then to yellowish green. Further addn. of 5 drops dil. HCl produces yellow, then addn. of 5 drops H_2O_2 forms blue, then bluish green, finally colorless (from synthetic $BzOH$); faintly yellow to colorless ($BzOH$ from gum). After several hrs. the soln. contg. the synthetic $BzOH$ has a violet tint. The use of a const. drop size app. is essential. S. W.

Ammonium salt of acetylsalicylic acid. M. N. DVORNIKOFF. *J. Am. Pharm. Assoc.* 18, 213(1929).—Following Woldman's procedure for making the NH_4 salt of acetylsalicylic acid (C. A. 23, 1215) D. obtained impure acetylsalicylic acid and not its NH_4 salt. Acetylsalicylic acid dissolves in NH_4OH to form the NH_4 salt. Excess acid dissolves in the warmed soln. and seps. on cooling. L. E. WARREN

The seeds of Monarda punctata. A. A. HARWOOD. *J. Am. Pharm. Assoc.* 18, 228-31(1929).—The seed contained moisture 3.6, ash 7.51, benzine ext. 28.3 and fixed oil 22.6%. The oil had d_{25} 0.9100, sapon. no. 173.3 and I no. 207.4. Thymol was absent; oleic acid was present. L. E. WARREN

The estimation of alkaloids in admixture with vegetable drugs. GEORGE E. ÉWE. *J. Am. Pharm. Assoc.* 18, 241-3(1929).—Extractives were shaken out from rhubarb, gentian, podophyllum, capsicum, cannabis and jalap, as well as tannic acid, with ammoniacal $CHCl_3$; aliquot portions of the soln. were evapd. and the residue was titrated with standard acid as in alkaloidal detns. In each case, except rhubarb and tannic acid, some acid was consumed. If alkaloids had been present the results would have been high. The expts. were repeated with the addn. of known amts. of strychnine followed by purification by the double shake-out procedure. The results indicated

almost complete recovery. The exact nature of the basic substance causing the apparent high alkaloidal results in the unpurified exts. was not ascertained.

Sirup of ferrous iodide and the official hydriodic preparations. H. V. ARNY, BENJAMIN VENER AND LESLIE C. JAYNE. *J. Am. Pharm. Assoc.* 18, 265-8, 384-91(1929). Sirup of FeI_2 and the other HI preps. of the U. S. P. X. were made according to the U. S. P. and with certain modifications. The preps. were kept under various conditions of storage and were examd. at intervals with respect to color, appearance and chem. analysis. The U. S. P. sirup of HI is satisfactory. The U. S. P. sirup of FeI_2 turns yellow and shows traces of ppt. In such deterioration I does not decrease negligibly. The turbidity or "scum," which sometimes forms in the sirup of FeI_2 , is $\text{Fe}(\text{PO}_3)_3$. Exposure to sunlight tends to prevent the formation of the scum. The sirup sets I free in absence of a stabilizer. Exposure to sunlight brings the free I into combination again. The U. S. P. sirup contg. free HPO_2 decomposed more than the others. However, the omission of the HPO_2 and $\text{C}_3\text{H}_5(\text{OH})_3$ as a stabilizer gave less satisfactory products. A specimen of sirup of FeI_2 made with invert sugar kept perfectly for 22 months.

Studies in bio-assays. "The strophanthins and ouabain." C. W. EDMUNDS, H. W. LOVELL AND S. BRADEN. *J. Am. Pharm. Assoc.* 18, 338-44(1929).—Four specimens of ouabain and 5 of strophanthin were obtained from various sources. All were subjected to well-known methods of assay by 2 observers working almost independently. Strophanthin is found on the market in 2 forms, one being about twice as strong as the other. Therefore, the U. S. P. should state the physiol. activity of the product described. The ouabain on the market appears to be of uniform activity and about twice as strong as strophanthin.

The non-heptane constituents of Jeffrey pine oil. P. A. FOOTE. *J. Am. Pharm. Assoc.* 18, 350-3(1929).—The chief constituent of the oil from Jeffrey pine is n-heptane. The non-heptane fractions from a large amt of the oil were obtained by fractionation above the b. p. of heptane. The aldehydes were removed by the usual sulfite process and were fractionated at 0.1 mm. into 50 fractions of 1° each. The b. ps. and ds. of the fractions are recorded. In some of the distillates n-octylic, n-nonylic and n-decylic aldehydes were identified.

Australian sandalwood oil compared with the official. EDWARD SWALLOW. *J. Am. Pharm. Assoc.* 18, 684-6(1929).—The U. S. P. sandalwood oil is obtained from *Santalum album* and must contain not less than 90% of alcs. as santalol. Australian sandalwood oil is obtained from *S. spicatum*. It contains 90-94% of santalol. Clinicians report that the Australian oil is equal in therapeutic efficiency to U. S. P. oil. It should receive recognition in U. S. P.

L. E. WARREN

A preliminary study on the standardization and stabilization of mydriatics and myotics. E. E. SWANSON, H. E. THOMPSON AND C. L. ROSE. *J. Am. Pharm. Assoc.* 18, 446-50(1929).—The cat-eye method of Munch (*C. A.* 21, 3423) was submitted to several collaborators. The alkaloids (or their salts) studied were atropine, ephedrine, hyoscyamine, pseudoeuphadrine, scopolamine, homatropine, pilocarpine, physostigmine and arcoline. Not all cats have the same threshold dose for the mydriatic drugs. The av. findings agree with values reported by Munch. Five tinctures of belladonna were tested. The results do not agree with the chem. assay; probably this is due to the variable proportions of scopolamine and hyoscyamine in the tincture, the mydriatic

values of the 2 alkaloids not being the same. The min. effective concn. found for pilocarpine and arecoline did not agree with the values found by Munch. L. E. W.

The buffer capacities of acacia and tragacanth. J. C. KRANTZ, JR. *J. Am. Pharm. Assoc.* 18, 469-73(1929).—Emulsions of cottonseed oil and mineral oil were prepd. with acacia and tragacanth in H_2O . Changes in p_H were produced by the addn. of NaOH or HCl. The most stable range for acacia emulsions lies between p_H 2 and 10.5 and for tragacanth between 1.9 and 2.3. Diln. with H_2O has but little influence on the p_H of acacia solns. Conclusions: The buffering effect of acacia on the acid or alkali added to the emulsions influences the stability of the emulsion. The buffering effect of tragacanth does not play as important a role in the stability of the emulsions as does acacia. L. E. WARREN

A new dihydroterpene. SIMON BLANCO. *J. Am. Pharm. Assoc.* 18, 474-7(1929).—A volatile oil was obtained from the seeds of *Ptilosporum pentlandrum* grown in the Philippine Islands. The following results were obtained: $d_{20} 0.7692$; $n_D^{25} 1.435$; $[\alpha]_D^{25} +20.0^\circ$; sapon. no. 0.67. The oil was fractionated, and from the $152-3^\circ$ portion a nitrobenzylamide was prepd., m. 146° L. E. WARREN

Abbreviations in the pharmacopeia X and in the National Formulary V. CHARLES C. PLITT. *J. Am. Pharm. Assoc.* 18, 487-90(1929).—A plea is made for uniformity. L. E. WARREN

Comparative chemical examination of different brands of acriflavine hydrochloride (acriflavine) and acriflavine base (neutral acriflavine). GEO. W. COLLINS AND ARANKA STASIAK. *J. Am. Pharm. Assoc.* 18, 659-69(1929).—Specimens of acriflavine and neutral acriflavine of domestic and foreign makes were examd for ash, H_2O -insol., loss over H_2SO_4 , loss at 100° , Cl content, N content and HCl content. No justification was found for the claim that foreign brands were of higher degree of purity than domestic. Acriflavine should be called "acriflavine hydrochloride." The amt. of H_2O is so variable that a formula giving 1 mol. of H_2O is not warranted. The appearance of several specimens of neutral acriflavine varied considerably. H_2O of crystn. is not present. Several brands contained considerable amts. of NaCl. The product should be called "acriflavine base." L. E. WARREN

Assay of ground flaxseed for non-volatile, ether-soluble extractive. JOSEPH L. MAYER. *J. Am. Pharm. Assoc.* 18, 683-4(1929).—In an attempt to shorten the U. S. P. method M. macerated specimens of the drug for 2 months with Et_2O , washed the material with the solvent, filtered the soln. and evapd. the residue. The 2 expt gave 30.5 and 30.6%, resp. With a Soxhlet app and the U. S. P. method the findings were 37.0 and 37.0%, resp. These tests indicate that the short method is unworkable. L. E. WARREN

Observations on the U. S. P. X. Test for Foreign Gums in Tragacanth. R. A. KONNERTH. *J. Am. Pharm. Assoc.* 18, 698(1929).—It was noted that after about Feb., 1928, no tragacanth appeared on the market which would conform to the U. S. P. X. $Na_2B_4O_7$ test. Every specimen gave a solid gel with this test (indicative of foreign gum). The specimens were of very fine appearance. The test should be revised or eliminated from the U. S. P. X. L. E. WARREN

Some notes on the U. S. P. sodium borate test for tragacanth. EARL B. FISCHER. *J. Am. Pharm. Assoc.* 18, 889-91(1929); cf. preceding abstract.—Specimens of tragacanth were rejected by dealers who reported that the drug did not respond satisfactorily to the U. S. P. $Na_2B_4O_7$ test. Since the products were of good appearance, investigation was started. Tests showed that too much $Na_2B_4O_7 \cdot 10H_2O$ is directed to be used. The proper amt. appears to be 0.6 g. instead of 2.0 g. L. E. WARREN

Solubility determination of U. S. P. chemicals. WOLFGANG SCHNELLBACH AND JOSEPH ROSIN. *J. Am. Pharm. Assoc.* 18, 762-71(1929).—The solubilities of $MgSO_4 \cdot 7H_2O$ in H_2O and in $C_2H_5(OH)$, at 25° were detd. The soly. in H_2O was detd. by weighing the residue on evapn., detg. the Mg and detg. the SO_4 . One g. of $MgSO_4 \cdot 7H_2O$ is sol. in 0.835 cc. H_2O , and 100 g. satd. soln. contains 54.57 g. of the salt. In the $C_2H_5(OH)$ test the Mg and the SO_4 were detd. One g. of $MgSO_4 \cdot 7H_2O$ is sol. in 1.08 cc of glycerol, and 100 g. of a satd. soln. contains 42.56 g. of the salt. The tendency of $MgSO_4 \cdot 7H_2O$ to retain its H_2O is greater than the tendency of $C_2H_5(OH)$ to absorb H_2O from the H_2O content of the salt. L. E. WARREN

Pyrethrum flowers. I. The quantitative determination of the active principles. C. B. GNADINGER AND C. S. CORL. *J. Am. Chem. Soc.* 51, 3054-64(1929).—Pyrethrin I and II have been isolated from Japanese *Pyrethrum* flowers; their action on alk. Cu soln. has been investigated and a table is given showing the wts. of pyrethrin I equiv. to amts. of dextrose from 0.750 to 2.875 mg. Based upon these values a method has

been described for detg. the % of active principles in *Pyrethrum* flowers. The % of pyrethrins ranged from 0.40 to 1.21% in the 16 samples of flowers examd.; the stems contain about 0.1 the amt. of pyrethrins found in the poorest flowers. Daisy flowers contain no pyrethrins. The active principles of Japanese *Pyrethrum* are the same as those of Dalmatian *Pyrethrum* flowers. The toxicity of the pyrethrins to cockroaches has been detd. The pure pyrethrins were extremely toxic to these insects.

Cr plating [for pharmacy utensils] (GUIDINI) 4. Monobromoguaiacol carbonate (CHERNOFF) 10. Derivatives of dihydrocodeinone and its substitution products (U. S. pat. 1,731,152) 10.

Curing tobacco. WALTER F. LILIENFIELD (to Lilienfield Bros.). U. S. 1,731,018, Oct. 8. In order to render mild and to cure strong tobacco, previously aged and fermented tobacco leaves are loosened and are subjected to a "machine created" ultra-violet ray for 15 min. to 2 hrs. to give them the desired mildness.

18—ACIDS, ALKALIES, SALTS AND SUNDRIES

E. M. SYMMES

The preparation of hydrazoic acid and its salts. W. HOTH AND G. PYL. *Z. angew. Chem.* 42, 888-91 (1929).—Alkali and alk. earth azides can be prepd. easily and safely by distn. under reduced pressure of HN_3 from NaN_3 and H_2SO_4 . Aq. solns. of HN_3 can be made from NaN_3 by decompn. with H_2SiF_6 or oxalic acid, and BaN_3 prepd. therefrom. BaN_3 and H_2SO_4 make pure, aq. HN_3 . Conditions for prepn. of KNH_2 and KN_3 by the Wislicenus method are given. KN_3 and $\text{Ba}(\text{ClO}_4)_2$ give BaN_3 very easily, and it can also be prepd. at a 30% yield from EtNO_2 , $(\text{NH}_4)_2$ and $\text{Ba}(\text{OH})_2$. LiN_3 can be made by decompn. of NaN_3 and LiCl in aq. alc. soln. E. M. S.

F. M. SYMMES

Problems of chemical economy in the nitrogen industry. H. GROSSMANN *Chem.-Ztg.* 53, 661-3 (1929).—A general review; illustrated. E. M. SYMMES

Preparation of alkali metal cyanides from their carbonates, carbon and nitrogen. N. A. FLEISHER *Trans. State Inst. Applied Chem. (Moscow)* No. 10, 5-27 (1928).—The literature and patents on prepn. of alkali cyanides from mixts. of alkali carbonates and C, acted upon with N gas at high temp., are shown. In actual tests the catalysts used were (I) powd. Fe (Ferrum alkoholisatum), (II) Fe obtained by reduction of $\text{Fe}_2\text{C}_2\text{O}_4$ with com. H, (III) the same, reduced with electrolytic H, (IV) the same, reduced with H obtained from Al and KOH soln. (V) freshly prepd. FeC_2O_4 from $\text{H}_2\text{C}_2\text{O}_4$ and FeSO_4 , (VI) $\text{H}_2\text{C}_2\text{O}_4$ and FeCl_2 . A wet mixt. of Na_2CO_3 1, charcoal (70.7% C) 0.7, Fe 0.17 was made into briquets, dried and heated in an Fe tube while passing through N under pressure at a rate of 1 l. per hr. Briquetting improves the NaCN yield, whereas the grade of Fe, the proportions and time of heating do not. The use of metallic Fe, not Fe salts, is essential. Moisture is detrimental. Addn. of metallic Mn (Ger. pat. 176,080) is superfluous. The best yield, 58% NaCN, was with II on heating at 990° for 1.5 hrs. When K_2CO_3 1.3, charcoal 0.7 and Fe 0.17 are treated as above, results show that the KCN yield is affected by the degree of coarseness of the Fe. The best yield, 55% KCN, was obtained with II on heating at 990° for 2.75 hrs. The same expts. under atm. pressure gave better yields, with Na_2CO_3 64% on heating at 1010° for 2 hrs. with I and K_4FeCN_6 , and in the case of K_2CO_3 the coarseness of the Fe had no effect and best yields (68%) were obtained with powd. cast Fe at 1010° for 2.5 hrs. and with a mixt. of VI and K_4FeCN_6 73% yield at 1030° for 2 hrs. K_4FeCN_6 alone gave practically negative results. K_2CO_3 gave the best yield, 74%, with IV at 1040° for 1.75 hrs. K_2SO_4 , with which com. K_2CO_3 is contaminated, has a decidedly detrimental effect on KCN yields. CHAS. BLANC

Preparation of barium chloride from wastes of the production of lithopone. F. N. STROKOV. *Trans. State Inst. Applied Chem. (Moscow)* No. 10, 28-35 (1928).—The solid residue left after leaching BaS from the fusion of heavy spar with C contains Ba-

SiO_2 and BaCO_3 , which are converted into colorless BaCl_2 by treating with HCl , evapg. to dryness, igniting for 1 hr. with a free gas flame, dissolving in H_2O , filtering, crystg. from CaCl_2 , filtering and drying in air. Analysis: BaCl_2 85.16, H_2O 14.93, CaCl_2 traces, Fe and SiO_2 none. CHAS. BLANC

Conversion of barium sulfide to barium chloride by the action of chlorine. F. N. STROKOV. *Trans. State Inst. Applied Chem.* (Moscow) No. 10, 36-56 (1928).—The work was undertaken to det. yields and essential conditions of proposed methods of prepn. of BaCl_2 from BaS by the action of Cl gas (U. S. 1,167,061). BaS was chlorinated by both wet and dry methods. The crude BaS was made from barite by reduction with C in lithopone manuf. In the wet process it was leached with hot H_2O , with hydrolysis of BaS to Ba(OH)_2 and Ba(SH)_2 . On cooling most of the Ba(OH)_2 and some Ba(SH)_2 pptd. In preliminary tests cold BaS solns. were filtered from Ba(OH)_2 and chlorinated, since it was found that vigorous and prolonged passage of Cl tends to excessive formation of BaSO_4 , rapid passage of Cl increases formation of BaSO_4 , chlorination to room temp. requires greater time and gives more BaSO_4 . 100 g. of com. BaS were extd. by boiling with 400 cc. H_2O , the hot BaS soln. was filtered from insol., heated to $85-90^\circ$ and treated with Cl until the soln. became milky, the temp. being maintained by the heat of reaction. The S ppt. was filtered off and the filtrate, contg. BaCl_2 , crystd. with yields of 95% BaCl_2 and 90% S , 27% of which is BaSO_4 . Of the Cl used, 80-94% reacted, depending upon the concn. of the BaS soln. The best results were obtained at concns. of 160-270 g. per l. BaCl_2 so obtained contained BaCl_2 84.82, H_2O 15.01, $\text{H}_2\text{O-insol.}$ 0.02 and no Ca or Fe salts. In the dry process preliminary results showed practically no BaCl_2 formation on passing dry Cl over BaS at $18-28^\circ$, but reaction began at above 60° , rose exothermically to 200° , and was maintained at $90-100^\circ$ by regulating the flow of Cl . This step was characterized by depositing S . The temp. then dropped, regardless of the amt. of Cl fed in. The mass was heated by a flame to 120° , and reaction continued with distn. of S_2Cl_2 , the temp. rising spontaneously about 200° . Conversion was complete in about 3 hrs., toward the end becoming slow and requiring a large excess of Cl , because Ba polysulfides are decompd. with difficulty. The mass was washed with C_6H_6 to remove S_2Cl_2 , dissolved in hot H_2O , filtered and crystd. Over 70% S_2Cl_2 was recoverable. Complete conversion of BaS to BaCl_2 is practicable by this method. For economy, chlorination may not be forced to the end until all the BaS and BaS_3 are decompd., giving a yield of 98.5% BaCl_2 . The wet method has the greater com. feasibility. CHAS. BLANC

Manufacture of potassium chlorate by double decomposition. C. MAZZETTI. *Ann. chim. applicata* 19, 273-82 (1929).—From a study of the equilibria $\text{KCl-KClO}_3\text{-H}_2\text{O}$, $\text{CaCl}_2\text{-Ca(ClO}_3)_2\text{-H}_2\text{O}$, $\text{KClO}_3\text{-Ca(ClO}_3)_2\text{-H}_2\text{O}$ and $\text{KCl-CaCl}_2\text{-H}_2\text{O}$, the old Liebig method of manuf. of KClO_3 from $\text{Ca(ClO}_3)_2 + \text{KCl}$ might be revived. From a study of the above isotherms the best conditions for optimum yield can be detd. A. W. CONTIERI

Gypsum: Its uses and preparation. R. M. SANTMYERS. *Bur. Mines, Circ.* 6163, 28 pp. (1929).—Eight primary and 6 manufactured uses of gypsum are discussed. One of these uses is application to cement, 9 types of which are mentioned. ALDEN H. EMERY

Development of the domestic gypsum industry, by states. R. M. SANTMYERS. *Bur. Mines, Circ.* 6173, 44 pp. (1929); cf. *C. A.* 23, 5278. ALDEN H. EMERY

The Haglund method of manufacturing alumina. ASSAR GRÖNWALL. *Teknisk Tid. Kemi* 59, 93-6 (1929).—Impurities in bauxite are removed by addn. of sulfide contg. materials and reducing in an elec. furnace. Pure Al_2O_3 crystallizes on cooling. The slag contains all foreign metals and some Al_2S_3 , which is later decomposed with H_2O to regain Al_2O_3 . This method is more economical than all older methods, and can be applied to bauxite contg. more SiO_2 than can be allowed in these. One ton of Al_2O_3 requires 4500 kw.-hrs. The furnace is lined with square C electrodes, which are not corroded by Al_2S_3 . Water-cooled Cu pipes are used for elec. conductors. G. R.

Preparation of pure alumina from Tikhvin bauxites. I. LILIEV. *Trans. State Inst. Applied Chem.* (Moscow) 1927, No. 8, 14-38.—Three samples of Tikhvin bauxite contained (I) 17.4, 40.6, 23.5; (II) 7.6, 63.5, 14.0; (III) 5.0, 74.5, 5.7 of SiO_2 , Al_2O_3 and Fe_2O_3 , resp. Al_2O_3 used for the manuf. of Al should not contain over 0.3% SiO_2 and 0.1% Fe_2O_3 . Methods of purification were investigated. Packard's process (Ger. pat. 182,444) gave very good results with I. Up to 90% Al_2O_3 was extd. and the unused Na_2CO_3 was only 4%. This process is inapplicable to II and III, which have a greater Al_2O_3 content, because the reactions do not take place according to the equations given by Packard, but are $\text{Na}_2\text{CO}_3 + \text{Al}_2\text{O}_3 = 2\text{NaAlO}_2 + \text{CO}_2$; $\text{Fe}_2\text{O}_3 + \text{Na}_2\text{CO}_3 = 2\text{NaFeO}_2 + \text{CO}_2$. At $800-900^\circ$ CaO reacts with SiO_2 and kaolin reacts with Na_2CO_3 .

to form an insol. aluminosilicate, only 12% of the kaolin decomposing into Na_2SiO_3 - NaAlO_2 and dissolving in H_2O . To obtain good results with these reactions it is necessary to use 1 mol. Na_2CO_3 per mol. Al_2O_3 and 1 mol. Na_2CO_3 per mol. Fe_2O_3 . Also, the ratio between Na_2CO_3 and CaCO_3 should be about 1.5:2. It is important that all ingredients be well ground and thoroughly mixed, then calcined at $875\text{--}925^\circ$ in an oxidizing atm., so that the Na_2CO_3 reacts completely with Al_2O_3 and to only a slight extent with kaolin. Unless calcination is done in such an atm. Fe and Cr oxides form, contaminating the aluminates. Washing with H_2O must be done at 90° , as at ordinary temp. a large amt. of SiO_2 compds. dissolve. Filtration of the alk. soln. gives no trouble. To sep. cryst. $\text{Al}(\text{OH})_3$ fractional pptn. may be used. The soln. must be 35° Bé. and $60\text{--}90^\circ$. The 3 fractions contain up to 0.1%, up to 0.3% and above 0.3% SiO_2 , resp. The remaining soln. solidifies and can be re-used as Na_2CO_3 . Under the above conditions 85–90% of the Al_2O_3 is extd. from the bauxites. **BERNARD NELSON**

Vanadium and some of its industrial applications. **JEROME ALEXANDER.** *Chemistry and Industry* 48, 871–8, 895 901(1929).—An account of the history and chem. relations of V, with its uses as catalyst, in metallurgy, pharmacy and therapeutics, ink, dryer, insecticide, fungicide, "fertiliser," purification of HCl, photography and glass. Bibliography. **W. C. EBAUGH**

Adhesives of vegetable origin. **HANS J. BRAUN.** *Metallbörse* 19, 2025, 2080–1 (1929).—Typical of a vegetable adhesive or sizing is that made from potatoes, thus: 100 kg. of potato starch is mixed with 300 l. cold H_2O to form a milky liquid, 24 kg. of soda soln. (36 38° Bé.) dild. with 5 kg. H_2O is added gradually, and stirring continued. The mass thickens, and 120 kg. of H_2O is added gradually. When clear the product is sterilized with Hg cyanide or β -naphthol, grotan, etc. For some purposes the alkali present is objectionable, so it is neutralized, in whole or in part, with HCl or HNO_3 , giving a paste with less adhesive strength. These acids may be replaced in part by H_3PO_4 , yielding an adhesive less likely to cause rust. Special treatments for particular kinds of adhesives are outlined. **W. C. EBAUGH**

Asbestos for chemical purposes. **E. VISLENEVA.** *Trans. State Inst. Applied Chem. (Moscow)* No. 8, 60 73(1927).—Asbestos suitable for use in Gooch crucibles, catalyzer support in H_2SO_4 manuf. and other chem. purposes was sought in Russia. Four samples were found and compared with Kahlbaum's crucible grade. Two were as good, but the mines have not been investigated geologically. Exploitation is difficult on account of the distance from railroads. One sample was too brittle, and another too unstable in HCl. An attempt to use serpentine asbestos, or the SiO_2 skeleton obtained after HCl treatment, showed that the substance was too hygroscopic to weigh. A detailed examn. of various species of asbestos is given. **BERNARD NELSON**

Structure and analysis of bleaching earths. **L. KALUSKY.** *Seifensieder-Ztg.* 56, 318(1929). K.'s published conclusions (*C. A.* 23, 3054) are based on original work; the samples were the fresh earths of commerce; the crude earths represented av. samples weighing 15 tons. Properly purified earths do not age easily, but earths with added peroxides, etc., age readily. **P. ESCHER**

Casein. **CH. PORCHER.** *Proc. 8th World's Dairy Congress* 1928, 800–10; cf. *C. A.* 22, 3672.—A review. **A. PAPINEAU-COUTURE**

The discoloration of commercial casein. **OTAKAR LAXA.** *Proc. 8th World's Dairy Congress* 1928, 810–11.—The discoloration on heating to 100° or over of certain caseins used for making artificial horn is shown to be due to the presence of amino acids (originating either from the use of partially decomposed milk for the manuf. of the casein, or from decompn. of the latter through its being kept moist). To prevent discoloration, they should be eliminated by washing with cold water. **A. PAPINEAU-COUTURE**

Carbon tetrachloride as a fire-extinguishing agent. **F. WIRTH.** *Chem.-Ztg.* 53, 651 2(1929).—Data from reports on the formation of COCl_2 from CCl_4 indicate that it is readily possible to have COCl_2 present in harmful quantities when CCl_4 is used as a fire extinguisher, but that with air currents removing it from the scene of action such dangers are minimized. For perfect safety gas masks provided with agents to protect against COCl_2 are recommended. **W. C. EBAUGH**

Heat economy in the lime kiln. **FR. LIPINSKI.** *Tonind.-Ztg.* 53, 1286–8(1929).—The heat balance for the lime kiln is worked out and it is pointed out that modern installations with mixed feed may approach rather closely to the theoretical. **F. O. ANDEREGG**

The cause of the deformation and the breaking of the stirrers in the mechanical pyrite burners. **K. SHABALIN.** *J. Chem. Ind. (Russia)* 5, 521–2; *Chem. Zentr.* 1928, II, 1712–3.—S. found that the rapid wear and breaking of the cast-iron stirrers and scrapers in the mech. pyrite burners is not due to the high temp. of the furnace, but is

due to the chem. effect of the pyrite-S. The analysis shows that the Fe of the scrapers is almost completely converted into FeS and that a layer of FeS₂ (mixed with FeS) has formed over it. S. assumes that in the transformation the S from the FeS₂-layer diffuses in one direction and the newly formed FeS diffuses in the opposite direction through the FeS-zone, thus giving rise to intermediate formation of FeS₂. G. S.

Sulfite liquor preparation from pyrites (LAUBER) 23. A ferro-alloy used in a plant for the preparation of synthetic NH₃ (RAFFO) 9.

Sulfur dioxide, etc., from iron pyrites. STANLEY I. LEVY. U. S. 1,730,514, Oct. 8. Iron pyrites is heated, in the absence of air, with Fe₂O₃, which serves to produce SO₂ and a residue readily reactive with HCl for producing H₂S and FeCl₂.

Decomposing complex hydrofluoric salts. MAX BUCHNER (to A. F. Meyerhofer). U. S. 1,730,915, Oct. 8. Complex salts such as Na₂SiF₆ or other fluosilicates or fluoroborates are heated by the action of hot gases, at a pressure less than atm. pressure, and under such conditions that no sintering takes place. Cf. C. A. 23, 2790.

Molybdenum phosphotungstate compounds. PAUL RABE, BERTHOLD WENK and ERICH HARTMANN (to General Aniline Works). U. S. 1,731,081, Oct. 8. By reduction of the 2 complex acids which have the general formula $n \cdot (WO_3 + MoO_3) \cdot P_2O_5 \cdot 3H_2O$, where n represents one of the numbers 24 and 18 (cf. Wu, C. A. 14, 2893) or their salts, new comds. can be obtained which are suitable for the manuf. of lakes. They form black crystals which are easily sol. in water with deep blue to violet color, stable in air and reconvertible into the molybdenum phosphotungstic acids by means of oxidizing agents. Cf. C. A. 22, 2816.

Phosphorus pentachloride from phosphate rock. CLAUDE G. MINER. U. S. 1,730,521, Oct. 8. Phosphate rock, silica and C are ground, formed into briquets, and the latter are heated in a reducing atm. in the presence of excess Cl to a temp. of redness or whiteness, PCl₅ formed is drawn off together with the excess Cl and C gases formed, and these products are cooled to below the decompn. temp. of PCl₅. An arrangement of app. is described. Cf. C. A. 23, 245.

Thorium hydride. HUGH S. COOPER (to Kemet Laboratories Co., Inc.). U. S. 1,730,723, Oct. 8. A specially described pure grade of Th powder is heated in H at 300-375° until the metal is substantially completely converted into hydride.

Recovering selenium from solutions. DANIEL L. OGDEN and ROGER I. VALENTINE (to United States Metals Refining Co.). U. S. 1,730,681, Oct. 8. SO₂ (in the absence of HCl) is introduced into a hot Se-bearing soln. such as a H₂SeO₃ soln. to ppt. Se in black amorphous form; the soln. is sepd., the wet ppt. is ground, and the Se is washed and dried.

"Synthetic" mineral fibers. MORRIS GROSSMAN. U. S. 1,730,609, Oct. 8. Na silicate is boiled with a soln. of NaOH under pressure for several hrs., the liquid is concd., the Na silicate is spun into fiber and the fiber is passed through a hardening bath of CaCl₂ soln. The product is resistant to heat and acids.

Rail filler. ALBERT C. FISCHER (to Philip Carey Mfg. Co.). U. S. 1,730,068, Oct. 1. Filler strips for placement along the sides of railway rails are formed of earthy material such as clay admixed with oil. Fibrous material may be added.

Cleaning and polishing fluid. EDWARD HAUGHEY. U. S. 1,730,654, Oct. 8. A compn. suitable for cleaning and polishing furniture, automobiles, etc., is formed of boiled linseed oil 63, turpentine 26, beeswax 8 and kerosene 3%.

Honing paste for use on razor strops. JAMES L. LANDER and GEORGE N. WHITE. U. S. 1,730,773, Oct. 8. An animal fat such as kidney fat is mixed with paraffin, paraffin oil, India rouge and finest Carborundum.

Composition for use as a shoe paste. EDMOND RETAILLIAU. U. S. 1,730,626, Oct. 8. PhOH 0.35, soap 1.8, ZnO 4.2, NH₄ sulfocinate 6.0, lithopone 13.0, citronella oil 0.1, glycerol 1.8, CaCO₃ 27.0, gelatin 4.0, aq. NH₃ 0.125 and water 41.625 parts by wt. are mixed together. Pigments may be added.

Waterproofed wrapped tubes. ARTHUR S. O'NEIL and ALBERT J. HINDRICH (to Western Cartridge Co.). U. S. 1,729,650, Oct. 1. A web of absorbent material such as paper is treated with an absorbable paste, rolled into a tube, and waterproofing material such as oil or varnish is applied to the surface of the tube before the paste has become absorbed, in order to facilitate impregnation by the waterproofing material.

Laminated dielectric sheets. HARRY P. MILLS (to Bakelite Corp.). U. S. 1,730,586, Oct. 8. One surface of a noncarbon-contg. sheet such as asbestos is coated with a C-free filler such as Na silicate and the uncoated side of the sheet is applied to a body

portion contg. a reactive phenolic resin, and the materials are subjected to heat and pressure together so that the resin only partially penetrates the sheet from the inner side and produces an integral union by hardening.

19—GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

G. E. BARTON, C. H. KERR

The constitution of glass. HERBERT SCHÖNBORN. *Sprechsaal* 61, 99–101, 117–20; *Chem. Zentr.* 1928, I, 2121.—General. C. R. FELLERS

Investigation of glass by the Margules method. M. VOLAROVICH. *J. Applied Phys. Moscow* 5, 185–91 (1928); *Physik. Ber.* 9, 2008 (in Russian with English summary).—The viscosity of a glass sample has been measured by the Margules method: the molten glass has been located in the clearance between a motionless Pt Ir cylinder and a concentric inside cylinder revolved regularly by the fall of a weight. The ranges were temp. 970–1390°, viscosities 176–21,700 abs. units. The viscosities could be calcd. satisfactorily by the Le Chatelier equation (cf. Deryagin and Khananov *C. A.* 23, 5375).

Investigation of the viscosity of glass by Stokes' method. B. V. DERYAGIN AND I. M. KHANANOV. *J. Applied Phys. Moscow* 5, 193–9 (1928); *Physik. Ber.* 9, 2008 (in Russian with English summary).—The viscosity of a glass sample has been detd. at various temps. by the Stokes method (falling Pt Ir ball). The results agree satisfactorily with those reported in the preceding abstr.

Antique glasses. BERNHARD NEUMANN. *Z. angew. Chem.* 42, 835–8 (1929).—Complete analyses of colored glasses from Egyptian, Babylonian and Roman sources are given. The widespread use of Cu, Mn and Fe (rarely Co) is noted. A. E. B.

Bichroux plate-glass process. J. E. FRAZIER. *Bull. Am. Ceram. Soc.* 8, 313–4 (1929).—A general description. C. H. KERR

Volatility of selenium and its compounds in the manufacture of ruby glass. J. B. KRAK. *J. Am. Ceram. Soc.* 12, 530–7 (1929).—About 75% of the Se added to the batch was lost by volatilization. Both Na_2SeO_3 and BaSeO_3 were stable at 950° and probably at higher temps. Regardless of whether Se or its compds. were used, the resulting glasses contained about the same amts. of Se. Methods of prep. Na_2SeO_3 and BaSeO_3 are given. A rapid analytical method of detg. Se in glass is given. C. H. KERR

Viscosity measurements in glass. H. R. LILLIE. *J. Am. Ceram. Soc.* 12, 516–29 (1929).—The concentric cylinder method (*C. A.* 23, 5375) was used for molten glasses. Results checked those of English and of Stott, but comparison with the results of Washburn indicates a difference supposedly due to his use of a variable calibrating factor. Measurements made by the use of a falling sphere gave results 25 to 50% higher than those given by the concentric cylinder method, possibly because of the extended extrapolation of Ladenburg's correction for finite boundaries. C. H. KERR

Clay. PAUL M. TYLER. U. S. Bureau of Mines, *Circ.* No. 6155, 62 pp. (1929).—Condensed information relating to the uses, properties, characteristics, testing, mining, technology and economics of clays. A bibliography is appended. K. D. JACOB

The burning of calcareous clays. OSKAR LECHER. *Chem.-Ztg.* 53, 669–71 (1929).—Methods of minimizing effects of CaO in clay ware are discussed. Analyses of limy clays are given.

A study of drying of clays and clay pastes. V. BODIN AND P. GAILLARD. *Bull. soc. encour. ind. natl.* 1929, 453–80.—Detailed tests on the drying time of French clays and clay pastes, with and without antiplastic materials, are given. E. M. SYMMES

Investigations for the improvement of potters' clays. GEZA JAKO. *Keram. Rundschau* 35, 283–5, 302–3 (1927).—A raw potters' clay, the analysis of which is given, served as the basis for expts. to det. the effects of various non-plastic admixts. on the resistance to crazing of the bodies after glazing. It is concluded that in a series composed of 50% of the raw clay and 25% each of two non-plastics the resistance to crazing is (1) best for bodies contg. magnesite and dolomite, (2) better for bodies contg. ground granite and ground slag than for those contg. ground clay grog or sand, (3) not as good for bodies contg. cement as for those contg. chalk. For bodies burned below 1000° the greater the amt. of clay substance present the more likely is the failure of the glaze.

The history of gilt (poliergold). I. II. F. CHEMNITZ AND P. NARR. *Chem.-Ztg.* 53, 573–4, 590–1 (1929). H. INSLEY
W. C. EBAUGH

The effect of various additive agents and treatments on the green strength of Missouri refractory clays. A. J. PAUL AND M. E. HOLMES. *J. Am. Ceram. Soc.* 12, 676-86(1929).—Tests were made with plastic and semiflint clays and burley diaspor. Aging plastic fireclay 10 days increased the modulus of rupture 38%. Na_2CO_3 treatment gave a 50% increase. Tannic acid produced some increase but an acid treatment after an alkaline treatment had no effect. The effect of developing bacterial growth was marked, especially when there was considerable aging. Adding bentonite (Collotone R) increased the modulus almost 3 times. The max. effect was with 8% bentonite. The additive effect of dextrin in combination with bentonite was positive but very small. Tennessee ball clay gave very little effect in amts. up to 8%. Na silicate, up to 8%, gave negative results. With flint clay, as little as 4% bentonite tripled the modulus. Aging helped greatly. With burley clay, bentonite increased the modulus to $4\frac{1}{2}$ times the original. Studies of mixts. indicated that the total colloidal content was the detg. factor. With 3% bentonite the modulus of flint clay is made equal to that of plastic clay. The deformation point of plastic clay dropped 1 cone for 3% and 2 cones for 6% addn. of bentonite. C. H. KERR

The rational (proximate) analysis of refractory clays by decomposition with sulfuric acid. HUBERT GREWE. *Arch. Eisenhüttenw.* 3, 43 8(1929).—The disagreements in the results of various methods for the proximate analysis of clay are caused principally by (1) the attacking of other constituents in the clay besides the clay substance, by the H_2SO_4 decompn. and (2) the residue of the decompn. not consisting entirely of KAlSi_3O_8 and quartz. A method giving satisfactory results is developed: In a porcelain dish (1000 cc.) are digested (5 min.) 1 g. clay (dried at 115°), 100 cc. H_2O and 5 cc. KOH (1:2); the mixt. is boiled (15 min.) and 100 cc. H_2O added. After cooling, 100 cc. H_2SO_4 (1.84) and 10 cc. HNO_3 are added. After heating in $1\frac{1}{4}$ hrs. to 140° and holding $1\frac{1}{4}$ hrs. here, the temp. is gradually (25 min.) raised to 230° and held here 35 min. After cooling, 600 cc. H_2O is added, the mixt. settled 2 hrs. and the clear soln. decanted off; to the residue 10 cc. HCl (1.19) and 50 cc. H_2O are added, the residue is heated on a H_2O bath (15 min.), filtered, washed with H_2O 3 times, the HCl treatment repeated until the weak green of the acid has disappeared. The residue is then washed into the dish, the vol. brought to 250 cc. with hot H_2O and 25 g. cryst. Na_2CO_3 (9 g. of calcined) is added. The mixt. is heated on a H_2O bath (2 min.), 5 cc. KOH (1:2) added, the mixt. heated (2 min.) again, filtered and the Na_2CO_3 KOH treatment repeated 3 times; the final residue on the filter is washed with H_2O contg. 5% alc., ignited in a Pt crucible and weighed. The difference between the initial and final wts is the wt. of clay. The ignited residue is decompd. by fusing with Na_2CO_3 and K_2CO_3 , the melt dissolved in dil. HCl, NH_4OH added in slight excess, the pptd. hydroxides filtered off and dissolved in HCl, and the Al_2O_3 pptd. with $(\text{NH}_4)_3\text{PO}_4$ and $(\text{NH}_4)_2\text{S}_2\text{O}_8$ as AlPO_4 from which the KAlSi_3O_8 in the original sample is calcd. The quartz is obtained by difference.

J. BALOZIAN

Experiments on the production of refractory clay ware. B. KAMER. *Keram. Rundschau* 35, 448-50(1927).—Formulas using Bohemian raw materials are given for the bodies, engobes and glazes of single-fire, cone-8, refractory clay ware. H. I.

Geologic relations of the diaspor and flint fireclays of Missouri. H. S. McQUEEN. *J. Am. Ceram. Soc.* 12, 687-97(1929).

C. H. KERR

Progress report on investigation of fireclay brick and the clays used in their preparation. R. A. HEINDL AND W. L. PENDERGAST. *J. Am. Ceram. Soc.* 12, 640 75 (1929).

C. H. KERR

An x-ray study of fire brick. ALBERT E. R. WESTMAN. Univ. Illinois Eng. Expt. Sta., *Bull.* No. 193, 16 pp.(1929).—The limitations of the petrographic microscope as a means for detg. the comps. of com. fire brick of fine structure led to the adoption of x-ray diffraction methods, whereby it was possible to obtain diffraction patterns of crystals as small as 50 A. U., as compared with those with diameters two thousand times larger; which were min. size for the other instrument. The diffraction patterns of all fireclay bricks were similar in appearance, mullite lines and one cristobalite line being present in all. Nearly all quartz lines were masked by those of mullite and cristobalite and the remainder were faint. The accuracy of estimates of amts. of each kind of crystal based on comparison of x-ray data with those from thermal expansion and petrographic measurements was not high. Moreover, there is no reason for believing that the 100,000 A. U. crystals are different in compn. from those whose diameters are smaller and the petrographic microscope should, therefore, prove adequate for such examns. The development of x-ray app. giving wider sepn. of the lines is desirable in the interests of ceramic research.

H. L. OLIN

Scum and efflorescence. ELLIS LOVEJOY. *Clayworker* 92, 205-8(1929).—Some

pertinent pointers are made relative to the causes and cures of scum and efflorescence of building brick. Some exceptions are taken to Palmer's statements (*C. A.* 22, 3750).

Dryer tests at the Bohnsack Brick Co. R. K. HURSH AND L. J. HAGEN. *Clay Worker* 92, 117-23(1929).

Development of zonal structure in silica brick. A. E. BADGER. *Fuels and Furnaces* 7, 1384(1929).—The colored zones of a silica brick taken from the crown of a glass tank are caused by migration of iron from the hot inner face of the brick as well as by the state of combination of the iron.

Some properties of silica bricks. L. LONGCHAMON. *Céramique* 32, 219-23 (1929).—L. discusses the raw materials, the quartz inversion, influence of alkalis, influence of Al_2O_3 , thermal expansion and refractoriness of siliceous products. Very pure quartz (99.9% SiO_2) was ground and then pressed into samples after the addn. of Na_2CO_3 . The samples were burned for 2 hrs. at 1250° and the densities were detd. The densities for 0.1, 0.2, 0.3, 0.4, 0.5, 0.6 0.7% Na_2O were, resp., 2.55, 2.41, 2.37, 2.34, 2.32, 2.30, 2.30. The decrease in d. shows the transformation of quartz to tridymite and cristobalite. The same expt. was performed with 0.5% Na_2O and 0.5, 1, 2 and 3% Al_2O_3 . The densities were, resp., 2.50, 2.55, 2.57, 2.30. It is evident that Al_2O_3 diminishes the speed of inversion of quartz and opposes the action of the alkalis. The thermal expansion of a sample of silica brick is always less than that which is calcd. from the mineralogical compn. However, if the sample is pulverized and again pressed into a specimen, the expansion is increased and agrees more closely with the calcd. This has been detd. by many repetitions of the expt. L. states that each crystal of SiO_2 in a silica brick is covered with a silico-calcareous cement and that the softening of such a brick at high temps. is due to the fusion of the cement.

Properties and specifications of silica bricks for coke ovens. H. KNUTH. *Feuerfest* 5, 21-6(1929).—Specifications include sp. gr., total porosity, silica content, durability and resistance to deformation at high temps.

Notes on terra cotta glaze consistency. H. SPURRIER. *J. Am. Ceram. Soc.* 12, 577-80(1929).

Lepidolite in cone 6 terra cotta glazes. H. E. DAVIS. *J. Am. Ceram. Soc.* 12, 570-1(1929).—There seems to be little or no improvement in the glaze except in beauty of glaze surface.

Ceramic research. J. W. MELLOR. *Bull. Am. Ceram. Soc.* 8, 269-72(1929).

Investigations in ceramics and road materials. 1927. Canada Dept. of Mines, *Mines Branch*, No. 697(1929).—Introduction. HOWELLS FRÉCHETTE. 1-3. An investigation on the treatment of certain western clays to overcome drying defects. HOWELLS FRÉCHETTE AND J. G. PHILLIPS. 4-16.—The cracking of several clays in drying was prevented by preheating the material to a temp. between 450° and 550° or by the use of grog plus 1 or more chem. coagulants; $FeCl_3$ or $FeCl_3 + NaCl$ were most efficient. Preliminary report on clay gathering. J. F. McMAHON. 17-25.—Costs ranged from 19 to 68.6 cents per ton of clay, and averaged about 38 cents for 20 plants. **Clays and shales of the Grand Lake Area, N. B.** HOWELLS FRÉCHETTE AND J. F. McMAHON. 26-45.—Tests on 13 samples of shales from the coal mines of this area show 12 suitable for ceramic use. Details of tests are given. **Road materials in Prince Edward Island.** R. H. PICHER. 46-59.—Results of a study of 16 deposits of conglomerate. **Stone quarries in Quebec.** R. H. PICHER. 60-7.—P. gives brief descriptions of 29 quarries. **The testing of non-bituminous road materials.** R. H. PICHER. 68-75.—P. describes methods of making tests on bed-rock for resistance to abrasion, toughness, hardness, sp. gr., H_2O absorption, cementing value and compression; on sand and gravel for granulometric analysis, character and shape of constituents, sp. gr., % of voids, abrasion, % of clay and silt, org. impurities and mortar tests. Methods of sampling are described.

Rapid method for the determination of boric acid in a borosilicate frit. WERNER MYLIUS. *Keram. Rundschau* 35, 550-2, 570-2, 585-7(1927).—The method comprises the fusion of the frit with KOH and the thrice repeated pptn. of SiO_2 , Al_2O_3 , PbO and other components after re-solution with a soln. of $Ba(OH)_2$. The total soln. obtained after filtering the ppt. is neutralized with 0.1 N HCl or 0.1 N $Ba(OH)_2$ and titrated in the presence of invert sugar sirup against 0.1 N $Ba(OH)_2$.

An alleged destruction of porcelain decoration by packing paper. BRUNO POSSNER VON EHRENTHAL. *Keram. Rundschau* 35, 532-3(1927).—A case of the bleaching of the colors in a porcelain decoration which had been ascribed to the chemical action of the paper in which the porcelain had been packed was found to be due to the electrolytic

action of metal and metal oxide particles in the decoration itself. The paper which had been in contact with these particles absorbed water and enhanced the electrolytic action.

H. INSLEY

The determination of the size of pore of ceramic filters by the systems air/liquid and liquid/liquid. H. BRECHOLD AND ROBT. SCHNURMANN. *Z. physik. Chem., Abt. A*, **142**, 1-24(1929).—The size of pore of ceramic filters is usually detd. from a measurement of the air pressure necessary to displace water from the filter. The authors have substituted MeOH, EtOH, Et₂O, *n*-PrOH, isobutyl alc., Me₂CO, CS₂, C₆H₆, PhNO₂ and toluene and found that the values agree very well with each other if the pores are not larger than 4 μ . For pores of greater size water and CS₂/air give larger values for the size than do the other liquids. When a system liquid/liquid (water/isobutyl alc.) was substituted for liquid/air, values were obtained which were 0.5-0.1 those obtained with the latter method. It is suspected that the wetting of the walls of the capillary by the second liquid may be responsible for the variations. The coalescing of subvisible droplets into visible ones (detd. by the viscosities of the liquids) may also exercise an influence. A balloon filter of Berlin porcelain, 3 types of Berkefeld filters, 4 types of Jena glass filters and 6 types of Chamberland thimbles were employed. Diagrams of app. and tabulated results are given.

E. R. SCHIERZ

The effect of water in expanding ceramic bodies of different compositions. H. G. SCHURECHT AND G. R. POLE. *J. Am. Ceram. Soc.* **12**, 596-604; *Bur. Standards J. Research* **3**, 331-41(1929).—With the exception of mixts. contg. blast-furnace slag or magnesite, most bodies with high absorptions developed considerable expansion. Adding magnesite improved the resistance to moisture expansion. Addn. of whiting, Fe₂O₃ and TiO₂ was not as beneficial as addn. of magnesite.

C. H. KERR

The capillary suction of some ceramic materials. A. E. R. WESTMAN. *J. Am. Ceram. Soc.* **12**, 585-95(1929).—A ball clay, a kaolin, flint, feldspar and mixts. of these were studied. The app. is described. Capillary suction decreases rapidly with increase in flint or feldspar. Ball clay had at least 3 times the capillary suction of kaolin.

C. H. KERR

Special depth gage for measurement and control of ceramic coatings. A. L. BENNETT. *J. Am. Ceram. Soc.* **12**, 572-6(1929).

C. H. KERR

Preparation of experimental sagger bodies according to fundamental properties. R. A. HEINDL AND L. E. MONG. *Bur. Standards J. Research* **3**, 419-44(1929).—Sec C. A. **23**, 4312.

E. C. M.

A new method of producing a salt glaze on ceramic ware. J. O. EVERHART. *Eng. Expt. Sta. News* (Ohio State Univ.) **1**, No. 6, 8-9(Sept., 1929).—A day slip of the same compn. as the body is used as a medium for carrying the salt. About 35% salt gave the best results. Spraying was better than dipping.

C. H. KERR

The effect of particle size of zinc oxide on the consistency of glaze slips. H. G. THOMPSON. *J. Am. Ceram. Soc.* **12**, 581-4(1929).—All brands of ZnO must be calcined. A small quantity of PbO is essential for satisfactory calcination. Calcining increases particle size. Control of consistency is therefore helped by calcining, because of the higher gravity and wider thinning range of the slip.

C. H. KERR

Fused quartz as a material for construction in the chemical industry. Z. VON HIRSCHBERG. *Korrosion* **4**, 25(1929).—A table gives the resistance of quartz to NH₄OH, NaOH, KOH, Na₂CO₃, Ba(OH)₂ and Na₂HPO₄.

M. C. ROGERS

Chemical and technological behavior of Roumanian kaolin. ALEXANDRU I. BRANISKI. *Bull. chim. soc. romăna stiinte* **29**, 15-77(1929); *Chem. Zentr.* **1928**, I, 2122. Kaolin from the several Roumanian deposits was examd. chemically, and by technological tests the value and adaptability of each deposit were detd. Sigistel, Medjidia and Popfalan clays were found best for fine ceramic ware, though the Fe content is high. Panic kaolin, after being freed from pyrites, ranks next in value for china ware. Zettlitz deposits possess very little plasticity. For porcelains, the kaolins of Parva, Dej and Rasca can be readily used. None of the Roumanian kaolins can be classed as really high grade.

C. R. FELLERS

Contributions to the knowledge of the physicochemical changes which take place in the burning of crystalline kaolin. L. MA RHODE. *Keram. Rundschau* **35**, 308-401, 414-5, 434-5, 452-4, 470-1(1927).—A well crystd. clay mineral ("pholerite") having the η and chem. compn. of kaolinite was the subject of the expts. Ground, air-dried samples were heated in a furnace at const. temps. for definite time periods. After cooling, the loss in wt., the η and the soly. in various reagents were detd. The wt. loss reached a different const. for each heating temp. and the max. wt. loss was obtained with a temp. of about 650°. The curve of wt. loss against η is a descending one, the η reaching a mean min. value of 1.48 at a wt. loss of 14% obtained by heating at 650° for 48 hrs.

The Al_2O_3 dissolved from the kaolinite by treatment with 6% HCl for 12 hrs. on a steam bath increased with the temp. of heating until a max. of 41.1% of Al_2O_3 was dissolved from material which had been heated for 2 hrs. at 750° . After 48 hrs. at 860° , 29.5% Al_2O_3 was dissolved, but after 96 hrs. at 860° only 1.3% Al_2O_3 was dissolved. The residue was an Al_2O_3 -free skeleton of silicic acid (a pseudomorph after pholerite) which retained the platy structure and a birefringence similar to the unheated crystals. The mechanism of the gradual production of "meta-nacrite" from "nacrite" or "pholerite" is unexplained as yet. After heating at 860° there is a sudden increase in n which remains practically const. until a temp. of 1200° is attained, when another sudden increase in n occurs. It is concluded that the residues after digestion with NH_4HF , and thorough washing are composed of a mixt. of Al_2O_3 and SiO_2 when the kaolin has been heated above 860° and below 1200° and that the residues are composed of mullite when the kaolin has been heated between 1200° and 1300° . H. INSLEY

Lead in red glaze. A. GRONOVER AND F. WOHLNICH. *Z. Untersuch. Lebensm.* 57, 360-3(1929).—The red glaze of certain culinary ware may contain PbCrO_4 and the conditions of extn. of the Pb for the purposes of analysis are discussed. It is recommended that the glaze be well scalded with hot water, $\frac{2}{3}$ filled with 4% vinegar and heated on the water bath for 30 min. Ten successive treatments of this type removed approx. the same amt. of Pb (about 7 mg.) for each extn. The Pb was detd. by Sudendorf and Penndorf's modification of Winkler's colorimetric method (*C. A.* 18, 134) and by the volumetric chromate method. After extn. a white, water-sol. efflorescence contg. carbonate, sulfate, acetate and Al was observed on the enamel. C. R. FELLERS

Refractory ceramics. I. The forms of zirconium dioxide. OTTO RUFF AND FRITZ EBERT. *Z. anorg. allgem. Chem.* 180, 19-41(1929).—The forms of ZrO_2 have been detd. with x-rays. The com. oxide, after preheating at 1200° , shows a reversible transition point at about 1000° from monoclinic to tetragonal symmetry. ZrO_2 freshly prepd. from the nitrate, oxalate or oxychloride below 600° , and cooled to room temp. shows a metastable tetragonal symmetry; but after a strong heating above 600° , this material does not differ from the com. oxide. The lattice const. and densities of both forms are as follows: monoclinic: $a = 5.174$ A. U., $b = 5.266$ A. U., $c = 5.308$ A. U., $\beta = 80.8^\circ$, $a.b.c. = 0.975:1:1.01$, $d = 5.68$; tetragonal: $a = 5.07$ A. U., $c = 5.16$ A. U., $d = 6.10$. Limited addns. of MgO , CaO , Sc_2O_3 , Y_2O_3 and CeO_2 to the solid phase and heating at 1700° cause a lattice transformation into a cubic system of the fluorite type. This cubic lattice is extraordinarily resistant toward thermic changes. The disintegration of refractory materials contg. ZrO_2 without foreign oxides is due to the cryst. transformation mentioned above. The addn. of foreign oxides stabilizes the lattice, insuring thus a very satisfactory refractory material. The same stable cubic lattice can also be obtained by mixing the necessary oxides with Zr nitrate, oxalate or oxychloride and heating then at 1400° : this method gives thus a mode of prepn. at lower temp. than the first-mentioned. It is highly probable that there exists a compd. $\text{Mg}_3\text{Zr}_2\text{O}_8$; the reasons in favor of its existence are thoroughly explained. Pure ZrO_2 does not retain its cubic structure up to its m. p. ALBERT L. HENNE

Refractories. F. TH. H. RAUCH. *Proc. Soc. Chem. Ind. Victoria* 27, Nos. 1-4, 1326-44(1927).—General discussion. K. D. JACOB

Glasshouse refractories of Europe. C. E. FULTON. *Bull. Am. Ceram. Soc.* 8, 315-9(1929).—General descriptions of equipment and processes at several plants. C. H. KERR

Dolomitic clinker as a stable basic refractory. M. E. HOLMES, W. J. McCAUGHEY AND G. A. BOLE. *Rock Products* 32, No. 15, 59-67(1929).—The field of stability in dolomitic clinkers lies in compns. contg. 5 to 8 or 9% SiO_2 provided a small amt. of Fe_2O_3 or Al_2O_3 (0.5%) is present. For rotary kiln practice addn. of Na_2CO_3 is necessary. RAYMOND WILSON

Recent advances in refractory material. W. OBST. *Feuerfest* 5, 4-5(1929).—A review of advances made since 1927. T. P. KELLER

The physical structure of refractory materials. THOMAS S. CURTIS. *Céramique* 32, 41-3(1929).—A review. A. J. MONACK

The permeability of refractory materials. R. V. WIDEMANN. *Céramique* 32, 185-95(1929).—W. describes the app. and presents data obtained on bauxite and aluminosiliceous refractories (Al_2O_3 varied from 20 to 38%) fired at different temps. A supplement gives a very detailed mathematical treatment of permeability. A. J. M.

Report of the Enamel Division Standards Committee, 1929. E. P. POSTE, *et al.* *Bull. Am. Ceram. Soc.* 8, 273-93(1929); cf. *C. A.* 23, 682.—A detailed report is made. C. H. KERR

Wet-process leadless cast iron enamels. A. I. ANDREWS AND C. H. COMMONS.

J. Am. Ceram. Soc. **12**, 557-65(1929).—Such an enamel is feasible. One good one and several fair ones were developed. The best results were obtained when the enamels were washed, but it is hoped that an insol. frit may be obtained. C. H. KERR

A method for testing the fineness of porcelain enamels. H. L. COOK. *J. Am. Ceram. Soc.* **12**, 566-9(1929).—A sieve-shaker method is described. C. H. KERR

Effect of soluble salts on the properties of enamels. R. R. DANIELSON. *J. Am. Ceram. Soc.* **12**, 538-47(1929).—If the mill liquors are excessively alk., the enamels have poor floating qualities. The ratio of free alkali to B_2O_3 dissolved from the frit is important in its effect on flotation. The value of an enamel clay cannot be detd. by floating the clay in H_2O . Tests must be made with the clay in the type of enamel with which it is to be used. In studying aging, the sol. salts must be considered. C. H. KERR

The effect on some colloidal chemical properties of kaolin of multivalent cations (ZHUKOV, SOKOLOVA) 2. Ball clays (SCOTT) 8. Colloid chemistry of the color problem of motley colored clays (GOGUEL) 8. Refractory materials used in Germany in the manufacture of chemical apparatus (KLIMOV) 1.

Porous refractory diaphragm for surface combustion apparatus. RUSSELL E. LOWE (to Doherty Research Co.). U. S. 1,731,053, Oct. 8. Structural features.

20—CEMENT AND OTHER BUILDING MATERIALS

J. C. WITT

French cement industry and its standards. H. PASSOW. *Zement* **18**, 994-6 (1929). H. F. K.

Recent investigation of cements. W. NAGEL. *Metallbörse* **19**, 1909-10, 1965-6 (1929).—Methods worked out in the Siemens labs. for investigating and standardizing cements are outlined briefly, with special reference to oxychlorides of Mg, Zn, etc.

W. C. EBAUGH

Aluminous fused cements in a magnesium sulfate solution. H. NITSCHÉ. *Zement* **18**, 973(1929).—Test specimens soaked in a 5% $MgSO_4$ soln. for periods up to 3.5 yrs. showed nearly as good compressive strength and better tensile strength than did those stored in tap water. H. F. K.

High-temperature cements. FRED A. HARVEY. *Fuels and Furnaces* **7**, 1401-7 (1929).—A discussion of the advantages of high-temp. cements over raw fireclay mixts. used to bond brick masonry. The method of applying mortar to bricks markedly affects the furnace life. A. E. BADGER

Anhydrite cement and its characteristics. P. P. BUDNIKOV. *Zement* **18**, 940-2 (1929).—The addn. of small quantities of $CuSO_4$ plus $NaHSO_4$ to deadburned $CaSO_4$ prevents the formation of "blooms" in the cement. With increasing CaO content the cement decreases in strength. It can be regenerated without the addn. of catalysts. H. F. K.

The relation of quality to cost of production of portland cement. EDUARDO TAYLOR. *Rock Products* **32**, No. 16, 64-5(1929).—The increased cost of fine grinding of a high lime raw mix is offset by better grindability of the clinker produced and lessened tendency to the formation of "fire rings" in the kiln. RAYMOND WILSON

Changes in characteristics of portland cement and high-early-strength cement during storage. HAEGERMANN. *Zement* **18**, 1022-8(1929).—Both kinds of cement suffered a reduction in sp. gr., degree of fineness, and early strength, and gained in loss on ignition with storage up to 1.5 yrs. H. F. K.

Composition and properties of the so-called natural cements. HAEGERMANN. *Zement* **18**, 861-8(1929).—See C. A. **23**, 4546. H. F. K.

Calculation of the compounds in portland cement. R. H. BOGUE. *Ind. Eng. Chem., Anal. Ed.* **1**, 192-7(1929).—The math. and graphic calcns. of the content of $4CaO \cdot Al_2O_3 \cdot Fe_2O_3$, $3CaO \cdot Al_2O_3$, $2CaO \cdot SiO_2$, $3CaO \cdot SiO_2$, uncombined MgO , uncombined CaO and $CaSO_4$ are described in detail. W. T. H.

Röntgen ray studies of cement. H. W. GONELL. *Zement* **18**, 968-9(1929). H. F. K.

Chemical, microscopic and Röntgen-ray analyses of alite and their results. A. GUTTMANN and F. GILLE. *Zement* **18**, 912-8(1929).—The examn. of the principle constituent of portland cement clinkers of different compn. showed this to be identical

microscopically with the crystal form alite and to consist chemically of practically pure tricalcium silicate. H. F. K.

The effect of calcium chloride on some of the physical properties of portland cement. S. UCHIDA. *Concrete* (Mill Section) 35, No. 4, 112-4(1929).—CaCl₂ accelerates the setting and hardening of portland cement, the optimum quantity being about 3% by weight of the cement. RAYMOND WILSON

The effect of the fineness of portland cement on its properties. P. FILOSOFOV. *Tonind-Ztg.* 53, 1302-4(1929).—A cement was sepd. into 2 fractions by sieving. Test specimens were made with various mixts. and it was found that the setting time depended upon the fineness. The 7-day tensile strength also followed the fineness, but 28-day and longer strengths were higher if the initial cement was not quite so fine.

F. O. ANDEREGG

The effect of organic impurities on the mechanical properties of portland cement. F. FEW. *Chem. Eng. Mining Rev.* 21, 441-3(1929).—F. assumes in his expts. that tannic acid is the harmful impurity in soil. 1:3 mortars were made contg. 0.1 to 0.5% tannic acid. In all cases 7- and 28-day tensile tests showed a weakening effect of tannic acid increasing with the amt. With 0.1% the tensile strength at the end of 7 days was 294 lb. per sq. in., with 0.3%, 184 and with 0.5%, 134 as compared with 297 with no tannic acid. At the end of 28 days the % loss was less. The compressive strength was affected likewise. H. C. PARISH

Effect of the temperature of salt solutions and of the mortar structure on the behavior of portland cement in active solutions. E. PROBST AND KARL E. DORSCH. *Zement* 18, 1090-5(1929).—The action of 15% solns. of Na₂SO₄ and of (NH₄)₂SO₄ was more severe on mortar specimens at a temp. of 30° than at 15° and -5°. Specimens made of Rhine sand were more dense and more resistant to these solns. than standard sand briquets. H. F. K.

Burning of cement in powder form. SCHIRM. *Zement* 18, 996-1000(1929).

H. F. K.

The theory of cement burning. HANS KÜHL. *Tonind.-Ztg.* 53, 1397-1401(1929).—An address. F. O. ANDEREGG

Lime combinations during the burning of portland cement. W. SCHRIEVER. *Zement* 18, 886-7(1929).—The progressive formation and combinations of CaO in different portions of the kiln were followed by the tensile and compressive strengths developed in the resulting cements. The greater part of the lime is combined with SiO₂ and Al₂O₃ before the calcination is complete. The later period of combination occurs where temps. of 1100-1300° are reached. H. F. K.

The setting of portland cement. DANIEL AVDALIAN AND E. N. GAPON. *Giorn. chim. ind. applicata* 11, 203-6(1929).—A math. paper. The velocity of setting of portland cement may be expressed by $1/t \log (w_0 - w_\infty)/(w_1 - w_\infty) = K$, in which w_0 is the value of any property at the start, w_∞ , the same property after set, and w_1 , this property at the time t . A. W. CONTIERI

Is the water-cement ratio the last word? NATHAN C. JOHNSON. *Eng. News-Record* 103, 471(1929).—It is pointed out that there are many problems for which the water-cement ratio offers no solution or clue. Sepn. and lack of uniformity in mix because of the wash-out action of too much mixing water are as important as reduction in strength. R. E. THOMPSON

The determination of iron oxide in the cement mill laboratory. ROBERT R. KING. *Rock Products* 32, No. 19, 72-3(1929).—K. recommends reduction of Fe in HCl soln. with SnCl₂ and titration with K₂Cr₂O₇, with diphenylamine as inside indicator. R. W.

Waste heat in cement mills and paper mills. H. B. SMITH. *Proc. Eng. Soc. West Penn.* 45, 269-96(1929).—First consideration must be given to continuity of service and flexibility, and to the draft loss upon which depends: the successful and efficient operation of the primary furnace, the net steam output and the life of the induced draft app. The draft loss is increased by air infiltration, improperly designed flues and too many turns and eddies. Gas velocities are an important feature of the design. Justification of a waste-heat installation depends upon the furnace cycle, the temps. of the gases and the cost of purchased power. The life of the induced-draft fans is materially extended by plating, either electrically or with C₂H₂ gas on the portions of the blades where the abrasion occurs. The burning of addnl. fuel in the waste-heat system during regular operation is inadvisable. Excess air must be kept to a reasonable min. Recent improvements in some installations in the cement and paper mills are indicated. An extended discussion is included—particularly relative to the value of interchange between the control stations and the industrial plant. W. H. BOYNTON

Grindability of portland cement clinker. ALTON J. BLANK. *Rock Products* 32,

No. 19, 50-2(1929).—Air-cooled clinker is more easily ground than water-cooled clinker in preliminary grinding; in finish grinding the relation is reversed. **RAYMOND WILSON**

Steam curing of portland cement mortars. A new crystalline substance. **T. THORVALDSON AND G. R. SHELTON.** *Can. J. Research* 1, 148-54(1929).—The rate of hydration of the cement increased with the temp. of the satd. steam. $\text{Ca}(\text{OH})_2$ crystals appeared almost at once, but after reaching a max. decreased in amt. At the same time a new cryst. product appeared, increasing as the $\text{Ca}(\text{OH})_2$ decreased. The stability of these crystals to sulfate solns. indicates that the increased resistance of portland cement mortars to alkali action produced by steaming is connected with the production of this cryst. material. The crystals are decompd. by dil acids but are stable in NaOH solns. Na_2SO_4 or CaSO_4 solns. do not attack them. They are slowly decompd. by MgSO_4 solns., however. They are apparently rich in CaO . A temp. of 135° does not change them. At 400° some roughening of crystals at edges occurs. Even after prolonged heating at 650° their entire cryst. structure was not destroyed. **H. C. PARISH**

Weathering of the Bremen Town Hall. **E. BLANCK AND A. RIESSER.** *Chem. Erde* 4, 137-44(1928).—A study of the chem. changes on weathering of the sandstone of the Bremen town hall shows the progressive changes with age. Analyses of fresh and weathered sandstone and sol. material derived on leaching are given. **J. F. S.**

Effect of coarse aggregate on the quality of concrete. **KURT PFLETSCHINGER.** *Zement* 18, 955-8, 977-80, 1005-8, 1035-40(1929).—The kind, size, surface factors and quantity of coarse aggregate affect the quality of concrete. With a sand having 20% below 50 mesh it was found that gravel gave higher compressive strength values than broken stone for the same cement content, while in transverse tests the reverse was true. Gradation of the coarse aggregate seemed to be of less importance. The attempt is made to base the amount of sand added to the batch by the size of the largest material in the coarse aggregate. The $\text{H}_2\text{O}/\text{cement}$ ratio is used in explaining results. **H. F. K.**

Effect of mixing time on the quality of concrete. **HALLER.** *Zement* 18, 900-2(1929).—By using sand and gravel aggregates in a 1:2:3:4 mix only minor differences in the compressive strengths were noted in the resulting concrete when the time of mixing the batch was varied $1/2$ -3 min. **H. F. K.**

Deterioration of concrete in hydraulic structures. **AXEL FRWALL.** *Concrete* 35, No. 4, 21-2(1929).—A summary of a report by the Swedish Board of Waterfalls. Permeability of concrete is given as the chief cause of deterioration. **RAYMOND WILSON**

Prevention of percolation through dams. **JOSEPH A. KITTS.** *Eng. News-Record* 103, 430(1929).—Discussion of paper by Bowers (*C. A.* 23, 4984). The factors affecting the quality of concrete are discussed, with particular reference to technical control and workmanship. The need of a pozzolanic constituent in concrete to convert the free lime to Ca silicate is pointed out. **R. E. THOMPSON**

Concrete aggregates and their application. **K. SCHAECHTERLE.** *Beton u. Eisen* 28, 313-20(1929).—Details have been worked out for the practical and economical application of modern ideas of aggregate grading and a description is given of a plant developed for that purpose. **F. O. ANDEREGG**

Building limes. I. Putty density and volume yield. **A. D. COWPER AND J. F. WILLIAMS.** *J. Soc. Chem. Ind.* 48, 276-9T(1929).—Detn. of putty d. of a lime adjusted to a standard consistence is a convenient method of detg. vol. yield. The d. of wet $\text{Ca}(\text{OH})_2$ is const. over a wide range of conditions. **E. M. SYMMES**

Twenty years of treated ties on the Northern Pacific. **ANDREW GIBSON.** *Eng. Maintenance* 25, 347-8(1929).—Since 1907 the Northern Pacific R. R. has been treating all of its track ties in plants at Brainard, Minn., and Paradise, Mont., using 80% creosote and 20% refined coal tar, or 50% creosote and 50% petroleum. With treated ties, the tie renewal has shown a decrease of about 53%, and practice has not only extended service life of timber but has permitted use of inferior woods. **R. C. BARDWELL**

Wood preservation. **KRHUZKAM.** *Chem.-Ztg.* 53, 650-1(1929).—The timber treating processes now in use in Germany are described. The preservatives used are ZnCl_2 , CuSO_4 , HgCl_2 , NaF combined with nitrated phenols and cresols, and creosote. The latter is used chiefly with the empty-cell or Rueping process. Ties are added and bored before treatment. Frequently the tie plates are applied at the plants before distribution on the railroad right-of-way. Tie treatment for the German railways is done mostly by privately owned plants under contract. **ALFRED L. KAMMERER**

Reinforced concrete [as water-pipe material] (SAVILLE) 14. Particle size and the properties of matter [in manufacture of portland cement] (NEVILLE) 2. Manufacture

of dolomite cements (ŠIMANĚ) 8. Mortar for the construction of coke ovens (ROBINSON) 21. Investigations in ceramics and road materials (ANON.) 19. A study of fiber wall boards for developing standards (SCRIBNER, CARSON) 23.

Cement from slag. JOHN G. BERGQUIST. U. S. 1,731,189, Oct. 8. Molten slag is taken from the furnace in which it is produced, poured into a second furnace where sufficient lime is added to form a dicalcic silicate, the product is permitted to cool and disintegrate to a powder, mixed with previously pulverized limestone, the mixt. is wetted and ground, burned to a clinker, and the clinker is ground.

Testing the consistency of concrete by use of a movable resistance indicator in the path of the moving material. ERICH H. LICHTENBERG (to Koehring Co.). U. S. 1,730,893, Oct. 8. An app. is described.

Waterproofing stone for use in road-building, etc. SAMUEL S. SADTLER (to Amiesite Asphalt Co. of America). U. S. 1,730,245, Oct. 1. Stone is heated to expel moisture, treated with a mixt. of fuel oil and kerosene or other non-saponifiable water-immiscible substance contg. a fatty acid of low volatility and sufficiently fluid to permit natural absorption by the stone, and allowed to stand to permit penetration by the treating material.

Arrangement of aggregate in pavements, etc. CLARENCE WRIGHT (to Wright Rubber Products Co.). U. S. 1,730,259, Oct. 1. Structural features of a pavement which may be surfaced with blocks of rubber.

Paving joint composition. ALBERT C. FISCHER (to Philip Carey Mfg. Co.). U. S. 1,730,000, Oct. 1. Paving joints are formed of a single compressible layer of bituminous material of sufficient thickness to form a complete joint and comprising vegetable blades such as those of *Yucca glauca*. Cf. C. A. 22, 3747.

Bituminous pavements. LEON R. MACKENZIE. U. S. 1,729,884-5, Oct. 1. Structural features.

21—FUELS, GAS, TAR AND COKE

A. C. FIELDNER

Fuel efficiency tests on batch oil stills. HENRY KREISINGER, W. R. ARGYLE AND W. E. RICE. Bur. Mines, *Bull.* 302, 94 pp. (1929).—Detailed combustion data (including thermal balances and efficiencies) of 103 tests on batch stills using the fire- and steam-method of distn. and fired with coal on chain grates and under-feed stokers, fuel oil and producer gas are given. Burning auxiliary gas under coke stills is unnecessary. Steam used in the fire- and steam-distn. process should be superheated to the temp. of the oil by waste flue gases. Air for combustion should be similarly preheated. By using high gas temps. and low excess air the fires will be operated more efficiently than at present, the time of distn. will be reduced, and thermal efficiencies will be increased. Higher efficiency can be expected from the use of oil or gaseous fuel than coal on a chain grate because of the ease of adjustment of the former to meet conditions. Distribution of charged heat was approx.: moisture in flue gas 7, combustible in ash 5, sensible heat in furnace walls 4, radiation and convection from furnace and still 4 and losses in dry flue gas and efficiency 80%. One-third of the coal and $\frac{1}{3}$ of the time were saved by skilful firing in a furnace properly redesigned and equipped with a stoker suited to the requirements of the process and the coal. Details of design are given; in general, parts subject to high temps. were shielded by arches and baffles were used to force the hot gases to scrub the max. surfaces of the stills at high velocity.

ALDEN H. EMERY

Comparative tests of various fuels when burned in a domestic hot-water boiler. E. S. MALLOCH AND C. E. BALTZER. Can. Dept. Mines, *Mines Branch, Rept.* No. 705, 92 pp. (1929); cf. C. A. 22, 310.—Detailed results and discussion of 123 tests using 30 fuels from peat to anthracite are given. The anthracites and cokes (fixed C 75-92%) gave high thermal efficiencies (av. 72.9%) and required only 10.78 lb. of fuel per therm of delivered heat. They required the least attention, gave the least clinker and usually produced a small amt. of ash. The semi-bituminous coals (fixed C 70-74%) averaged 65.8% thermal efficiency and used 11.07 lb. of fuel per therm. They produced less refuse than the anthracite and coke, but required much more attention. The Alberta sub-bituminous and domestic coals (fixed C 39.8-50.5%) ranged from 58.5 to 63.3% (av. 60.8%) thermal efficiency and required from 14.77 to 19.06 lb. of fuel per therm. The refuse was about an av. of the preceding but clinker formation was much greater. More attendance was required than for the preceding. Peat (fixed C 22%) gave a thermal

efficiency of 54.4% and used 25 lb. of fuel per therm. It demanded the most attention.

Alcohol for power purposes. FREDERIC NATHAN. *Trans. Fuel Conference, World Power Conference, London 1928 3*, 1255-71(1929).—By a consideration of the alc. yield per acre of various vegetables, together with the costs of production, alc. is ruled out as a possible motor fuel except under special conditions. ALDEN H. EMERY

Coal washing. A. MORREAU. *Rev. ind. minérale 1928*, 335-40, 349-58, 373-80.—The math. relationship between the elementary and the cumulative washability curves of the coal is given and a graphical method is shown for deriving either one or the other and for detg. the content of the washed coal, middlings and refuse. The mixing of coals of different characteristics before or after washing is discussed mathematically and graphically. Mixing after washing is usually preferable. The washability curves are detd. from jigging tests in a small washer or by heavy-liquid sepn. The use of such curves in choosing a suitable washer is discussed. B. M. BIRD

Temperature for rapid self-heating of powdered coal and the semicoke made therefrom. F. A. HARTGEN AND DAVID F. SMITH. *Bur. Mines, Repts. Investigations No. 2960*, 5 pp., 18 figs.(1929).—The temp. for the rapid self-heating of coal is from 50° to 80° less than for coke (195°). ALDEN H. EMERY

Low-temperature carbonization. C. H. LANDER AND F. S. SINNATT. *Trans. Fuel Conference, World Power Conference, London 1928 3*, 997-1014(1929); cf. *C. A.* 22, 2653, 3757; 23, 2015.—A general discussion is given. A table gives complete data (amts. and compn.) on the yields from 11 low-temp. processes. ALDEN H. EMERY

The Pehrson process for low-temperature carbonization. W. R. CHAPMAN. *J. Soc. Chem. Ind.* 48, 267T(1929); cf. *C. A.* 23, 5027.—Any coking slack can be used for carbonization, and the size of solid fuel obtained can be controlled by regulation of the preheating process. W. C. BRAUGH

The present state of low-temperature carbonization in Germany. R. HEINZE. *Trans. Fuel Conference, World Power Conference, London 1928 3*, 1015-91(1929).—For the low-temp. carbonization of brown coal, externally heated retorts, such as the Rolle, Streppel, Sauerbrey, Honigmann-Bartling, Geissen, and O. Heller, and ovens heated internally by gases, such as the Limberg, Lurgi, Drawe and Pintsch for raw coal and the Allgemeine Vergasungs-Gesellschaft, Seidenschur-Pape, Deutsche Erdöl A. G. and Humboldt for briquets, are individually described and illustrated. Mainly the rotary-type retort is used for the carbonization of true coal. Only the K. S. G. type is still in operation. The Doppelstein ovens and the Chemisch-Technische Gesellschaft cells are discussed. The Delkeskamp process is used for enriching the calorific value of low-grade fuels, such as brown coal, lignite, peat, etc., by reducing the CO₂ and H₂O and increasing the fixed C. The article is profusely illustrated. ALDEN H. EMERY

Peat fields in Latvia, and the use of peat as a fuel. P. NOMALS. *Trans. Fuel Conference, World Power Conference, London 1928 3*, 1148-62(1929).—Tables are given showing the area of individual peat fields in Latvia (total 643,300 hectares); partial analyses (ash, H₂O, vol. of dry peat/cu. m. of wet peat, calorific value, and energy/cu. m. of wet peat) of material from different depths of 9 bogs; analyses of ash (moss 1-5%, grass 5-10%); analyses of dry peats for volatile matter, ash and fixed C; analyses of dry org. matter from peat for volatile matter (52-70%) and fixed C (30-48%); ultimate analysis of dry org. matter (C 52-60, H 5-7, O 31-41, N 0.7-3.4); and fuel value of prepd. peats. Peat furnishes less than 2% of the yearly fuel requirements of Latvia. ALDEN H. EMERY

Methods employed in the U. S. S. R. for the production of peat. SCIENTIFIC EXPERIMENTAL INSTITUTE OF PEAT (RUSSIA). *Trans. Fuel Conference, World Power Conference, London 1928 3*, 1163-86(1929).—Eight methods of cutting peat are described with efficiency and production figures for each. ALDEN H. EMERY

Peat combustion practice in the U. S. S. R. SCIENTIFIC EXPERIMENTAL INSTITUTE OF PEAT (RUSSIA). *Trans. Fuel Conference, World Power Conference, London 1928 3*, 1187-1210(1929).—Tests of peat combustion on chain grates are given and a new type, a disk grate, is described. ALDEN H. EMERY

Peat treatment. GUSTAV KEPPELER. *Trans. Fuel Conference, World Power Conference, London 1928 3*, 1123-30(1929).—The heating value of peat (5200 cal./kg.) is hardly sufficient to drive off the H₂O(90%) if used directly as fuel. Air drying of sods produces a bulky fuel which easily reabsorbs H₂O. If ground peat is dried, the colloidal humus forms a dense mass (including the plant residues) which will not absorb H₂O. The mass can be molded into briquets. Artificial drying is difficult. Pressure drying can be done at low pressures, but the time element is considerable. Peat is excellent for gasification; the gas has a heating value of approx. 1400 cal. If low in H₂O (30%) it can

be carbonized (450–600°). The coke is low in ash ($2\frac{1}{2}$ –4%) and contains 0.2–0.33% S.

ALDEN H. EMERY

The drying of peat. NILS TESTRUP AND THOMAS GRAM. *Trans. Fuel Conference, World Power Conference, London 1928* 3, 1131–47(1929).—Various methods of drying peat are described. A 4-effect steam drier was most effective, economically reducing H_2O from 80 to 10%. Power could be produced (30,000 kw. capacity) at about 0.13 cents per kw. hr. at 100% load factor and about 0.2 cent at 60% load factor from peat so treated.

ALDEN H. EMERY

Experimental work on the artificial dehydration of peat and its conversion into powder and briquets. SCIENTIFIC EXPERIMENTAL INSTITUTE OF PEAT (RUSSIA). *Trans. Fuel Conference, World Power Conference, London 1928* 3, 1211–32(1929).—A method for the dehydration of hydraulically produced peat to 15% H_2O is described. It consists of coagulation with $Fe(OH)_3$, vacuum filtration, high-power pressing and drying in rotary steam driers. Highest quality briquets are made when the peat contains 15–18% H_2O .

ALDEN H. EMERY

Analysis of a peat profile. REINHARDT THIESSEN AND R. C. JOHNSON. *Ind. Eng. Chem., Anal. Ed.* 1, 216–20(1929).—A study of the microbiological formation of peat was undertaken with the assumption that a better knowledge of the nature and chemistry of peat should reveal the nature and chemistry of coal.

T. P. KELLER

Acids of montan wax. D. HOLDE, W. BLAYBERG AND H. VOHER. *Brennstoff-Chem.* 10, 101 8, 124 8(1929).—The Et esters of the acids are fractionally distd. at low pressure. The acids are then set free and sepd. by fractional pptn. of their Li salts. An acid, $C_{28}H_{56}O_2$, m. 84.4°, is sepd. and identified. An iso-acid, $C_{22}H_{44}O_2$, m. 89°, is also isolated and an acid, $C_{30}H_{60}O_2$, is also probably a constituent of montan wax. An acid, $C_{29}H_{58}O_2$ (C. A. 16, 2111, 3464; 23, 4326) was not isolated. The methods available permit of only approx. quant. sepn. of the homologous fatty acids.

Analyses of some natural gasoline gases before and after treatment. H. C. ALLEN. *Ind. Eng. Chem., Anal. Ed.* 1, 226–7(1929).—Three typical natural gasoline gases were analyzed and the results discussed in conjunction with plant operations.

T. P. KELLER

Determination of neon in natural gas. N. P. PÉNTCHEFF. *Compt. rend.* 189, 322-4(1929).—First remove the common gases from 5-6 l. of natural gas by means of Ca, CuO, etc., then treat with C black at the temp. of liquid air. In this way a mixt. of Ne and He can be isolated. By detg. the d. the He content can be estd. W. T. H.

Standard methods for avoiding gas leaks. A. SCHAFER. *Gas Wasserfach* 72, 921-7(1929).—Correct methods for laying and joining pipes are discussed as well as causes of corrosion and methods for preventing corrosion. A novel method of using a water seal completely to isolate a portion of the mains is given. Gas leaks are detected by smelling special "smelling pipes" or by smelling adjoining manholes before trouble occurs. In a test of workmen, it was discovered that 74% could smell 1.5% gas, 59%, 1% gas and 36%, $\frac{1}{2}$ % gas. R. W. RYAN

Heating Martin furnaces with mixed blast-furnace and coke-oven gas. M. CONTE. *Chaleur et ind.* 9, 384-9(1928). S. L. B. FETHERTON

The treatment of spent gas liquors. A. C. MONKHOUSE. *Surveyor* 76, 37(1929).—The compn. of gas liquor is divided into 3 groups: "free" NH_3 salts, "fixed" NH_3 salts and phenols; higher tar acids; and pyridine bases. Percolating filters have handled gas wastes contg. 8% spent gas liquor without drop in filter efficiency. A. L. ELDER

The reactivity of coke. D. J. W. KRENLEN. *Brennstoff-Chem.* 10, 128-31, 148-53, 168(1929).—Reactivity is detd. by passing air over a sized coke sample in a Pt boat heated in an elec. tube furnace. After charging, the sample reaches the furnace temp. in 2 min. Air is then passed for 5 min. at 20 l. per hr. and the CO_2 formed is absorbed and subsequently weighed. Reactivity is expressed in mg. CO_2 formed per sq. cm. of coke surface exposed. K. believes that in controlling the area of coke exposed he has eliminated the effect of particle size and that of blanketing of the coke by CO_2 previously formed so that he detcs. only reaction velocity, which he calls the true reactivity of the coke. Curves given, in which reactivity is plotted against temp., show a wide variation in reactivity within the range 500-600°, but a small variation at 800°. The main conclusion is that at temps. 800° and above, the true reactivity for all cokes is practically the same. J. D. DAVIS

Removing combustible coke from coke ash at Krefeld. KURT BEUTHNER. *Gas Wasserfach* 72, 927-8(1929).—A description is given of the Krefeld plant for removing combustible coke from producer ashes. Screened ashes are passed over a magnetic separator. About 100 tons of coke of 15-20% ash is prepd. from ash contg. 15-20% combustible, at a cost of 3 to 4 M per ton. R. W. RYAN

The present status of the low-temperature coking of coal in Germany. R. HEINZE AND A. THAU. *Papier-Fabr.* 27, 456-8(1929).—A brief survey. R. H. DOUGHTY

Mortar for the construction of coke ovens. P. B. ROBINSON. *Feuerfest* 5, 13 5 (1929).—A good mortar must have the proper plasticity, cohesion and be impervious to gases. Recommended mortars: for fire brick, 50-25-25 of clay, grog and sand; for silica brickwork in coke ovens, 10-30-60 of plastic clay, grog and ganister; for construction in gas works a mortar of finely ground ganister with 5% of lime. T. P. K.

Properties and specifications of SiO_2 bricks for coke ovens (KNUTH) 19. Fuel saving in steel making (DE MARÉ) 9. Certain principles in the extended utilization of blast-furnace gas (RICE) 9. The thermal behavior of the phenols (HAGEMANN) 2. Strainer for liquid fuels (U. S. pat. 1,730,360) 22. System of partial liquefaction for separating H from gaseous mixtures such as coke-oven gas (U. S. pat. 1,730,805) 13.

Hydrogenating carbonaceous materials. PAUL DANCKWARDT. U. S. 1,730,997, Oct. 8. Material such as a mixt. of coal or wood and oil or tar is forced together with H and steam under high pressure through a body of molten metal hydroxide such as NaOH and subjected to electrolysis with finely divided Ni as the negative pole and an anode consisting of an elec. conductor through or near which fixed hydrocarbon gas is injected; the C-contg. material is permitted to escape into another vessel where the light hydrocarbons may be sepd. from the heavier ones, and the latter and the fixed C-contg. material are returned to the electrolyzer for retreatment. An app. is described.

Muffle furnace and retort construction suitable for carbonizing coal, etc. FRANK C. GREENE and OTTO H. HERTEL. U. S. 1,730,570, Oct. 8. Structural features.

Apparatus for distillation of solid carbonaceous material such as coal. OTTO H. HERTEL. U. S. 1,731,165, Oct. 8. Details are described of an app. comprising a vertical retort through which extends a vertical rotatable pipe (within which a gas burner is

mounted) which on rotation creates a passage through the charge and which serves also to supply heat to the interior of the charge. The retort is also externally heated.

Furnace and vertical cylindrical retort construction, etc., for coal distillation, etc. FRANK C. GREENE and IRVING F. LAUCKS (to Old Ben Coal Corp.). U. S. 1,730,569, Oct. 8. Structural features.

Boiler furnace efficiency determination. JACOB M. SPITZGLASS (to Republic Flow Meters Co.). U. S. 1,730,541, Oct. 8. An index of the state of the flue gases is obtained by measuring the percentage of CO_2 in them; the temp. of the flue gases in the stack is detd. as is also the temp. of the air supplied to the furnace, and the difference between these temps. is multiplied by the reciprocal of the CO_2 percentage, to give a factor approx. proportional to the loss of efficiency in the furnace. Cf. C. A. 22, 4280.

Rotating gas-producing furnace. HUMPHREYS & GLASGOW, LTD., and ARTHUR GRAHAM GLASGOW. Ger. 481,245, April 16, 1926. Details of construction.

Battery of horizontal coke ovens. GEORGE T. BRUUN (to Koppers Co.). U. S. 1,730,602, Oct. 8. Structural features.

22—PETROLEUM, LUBRICANTS, ASPHALT AND WOOD PRODUCTS

W. F. FARAGHER

Constituents of wood spirit and acetone oils. IV. H. PRINGSHEIM, A. SCHREIBER, A. BEISER, W. DOSTER, H. LOOFMANN, G. POJARLIEFF, B. ROSEN and E. STEINITZ. *Cellulosechemie* 8, 45 66(1927); cf. C. A. 19, 240, 3087; 22, 682.—The following compds. were isolated from the water-sol. portion of the wood spirit light oil (I): Me_2CO , glycol diethyl ether, allyl alc. and crotonyl alc.; from the water-sol. portion of the wood spirit heavy oil (II): Me_2CCHO , MeCOEt , glycol diethyl ether, isovaleraldehyde and methylcyclopentanone; from the fraction b. $135\text{--}50^\circ$ (III): α -methyl-, dimethyl- and trimethylcyclopentanone (?) and 1,2,4-trimethylbenzene; and from the acids (esters) and lactones: n -methylvalerianate, α -hydroxybutyric acid, caproic acid, enanthic acid, the lactones of the acids $\text{C}_{11}\text{H}_{20}\text{O}_4$ and $\text{C}_{11}\text{H}_{22}\text{O}_4$, valerolactone, a lactone of the compn. $\text{MeCH}_2\text{CH}(\text{C}_6\text{H}_{11}\text{O}_2)$, α -methyl- Δ^6 -hexenoic acid, Δ^6 -heptenoic acid and lactones of the compn. $\text{C}_{14}\text{H}_{24}\text{O}_2$ and $\text{C}_{17}\text{H}_{30}\text{O}_2$. The following were isolated from the light oil of the acetone oil: Me_2CO , MeCOEt , MeCOPr , MeCO-iso-Pr and EtCOPr ; from the heavy oil: methyl-, dimethyl- and trimethylcyclohexanone, dimethyl- and trimethylcyclohexenone, enanthaldehyde, an aldehyde of the compn. $\text{C}_8\text{H}_{14}\text{O}$, hexahydrobenzaldehyde and cyclohexylpropionaldehyde.

L. C. FLECK

The national [Italian] combustibles problem. F. CARNEVALI. *Chim. ind. agricolt. ital.* 5, 41 2(1929).—A statistical review of the present and future supply of Italian petroleum fields, particularly of the Ragusa District, which can yield about 200,000 tons of mineral oils yearly.

G. A. BRAVO

Scientific foundations of the refining of petroleum. A. E. DUNSTAN. *Fuel Science Practice* 8, 334 54(1929).—Modern petroleum refining practice is discussed under the following headings: chem. and phys. nature of petroleum, typical absorption, plant, application of natural gasoline, conversion of natural gas into liquid products, removal and recovery of S from gas, stabilization of natural gas and distn. methods. II. *Ibid* 441–56.—The refining of petroleum distillates by the following methods is discussed: soda washing, the hypochlorite process, litharge process, acid refining and the Eckmann process. The use of bauxite for the adsorption of organic S compds. and coloring matter from petroleum distillates is recommended. Exptl. data are given as proof of the verification of the Freundlich law as applied to the adsorption of S and color compds. from kerosene by bauxite. Only certain S compds. are physically adsorbed by bauxite, others, including mercaptans, are oxidized by contact with the air held in the bauxite and converted into compds. capable of being retained by the filters. D. A. R.

Novel features in Wilcox Refinery. W. T. ZIEGENHAIN. *Oil Gas J.* 28, No. 12, 40, 152(1929).—At the H. T. Wilson Refinery, Bristow, Okla., the kerosene and fuel-oil cuts from the main fractionating tower are stripped of their lightest fractions by the aid of steam superheated in the pipe still to 900°F . The light fractions are returned to the main tower. In both the main tower and the kerosene-stripping tower part of the condensed overhead stream is returned and sprayed over the top of the tower for control. The coke from cracking the fuel oil in the Dubbs unit is pulverized and sold as fast as produced.

EMMA E. CRANDAL

Anomalies in the viscosity of mineral oils containing paraffin in suspension. L.

EMANUELI AND E. DA FANO. *Giorn. chim. ind. applicata* 11, 261-3(1929).—Deviations in the viscosity of several extra-heavy mineral oils from the law of Poiseuille were due to minute paraffin particles being suspended in the oil, as was proved by making up such suspensions. A. W. CONTIERI

The relation between physical characteristics and lubricating values of petroleum oils. E. D. RIES. *Ind. Eng. Chem., Anal. Ed.* 1, 187-91(1929).—Gravity and color have no direct relation to the lubricating action of an oil. The A. S. T. M. cold test does not give the point at which flow ceases. The notion that Pennsylvania oils give a higher Conradson C test because of the presence of paraffin is disproved by comparative tests. The wax serves as a diluent and lowers the % of hydrocarbons that crack and yield C in the Conradson test. Flash and fire points are not as good indications of volatility as distn. under vacuum. By taking the ratio of viscosity at 100°F. to viscosity at 210°F. as a temp.-viscosity coeff., paraffin-base oils have a lower temp.-viscosity coeff. than naphthene-base, and the viscosity of vacuum-distd. paraffin-base oils is still less affected by temp. EMMA E. CRANDAL

Recent development in the art of cracking in the vapor phase. C. R. WAGNER. *J. Inst. Petroleum Tech.* 15, 484 92(1929); cf. *C. A.* 23, 4052.—A historical review of development in the art of cracking petroleum oils. The first attempts to crack were directed to vapor-phase processes but excessive coke and fixed-gas formation as well as the excessive furnace temp. required and the difficulty of treating the product obtained retarded the development of this type of cracking. All of these drawbacks have been largely overcome in recent years, however, and it is now possible to produce economically good yields of anti-knock gasoline by vapor-phase cracking processes. D. F. BROWN

Action of aluminum chloride on hexahydroaromatic and saturated aliphatic hydrocarbons. REGINALD STRATFORD. *Ann. combustibles liquides* 4, 83 108, 317-59(1929).—See Grignard and S., *C. A.* 18, 3110. R. E. SCHAAD

Govers process built on use of diphenyl as indirect heating medium. G. H. REID. *Refiner and Natural Gasoline Mfr.* 8, No. 10, 63 80(1929).—The Govers process, which consists of vacuum distn. of skimming plant residuum followed by extrn. of paraffin with solvents and redistn. under vacuum, makes use of diphenyl as a heating medium for the first time. Diphenyl is a solid, flaky material which m. 70°, b. 251° and is not decompd. up to 490°. Its vapor pressure is 110 lb., its sp. heat is 0.4 and its latent heat of vaporization is 110 B. t. u. at 400°. It is non-corrosive and non-inflammable. An app. is described for utilizing this heating medium. J. L. ESSEX

Various Emba crude oils. N. D. GRAMENITZKII. *Neftyanoe Khozyaistvo* 16, 516-26(1929).—The characteristics of crude oils from various fields located in the Emba area are given. A. A. BOEHTLINGK

Some notes on a portion of the Lizard Springs anticline. R. H. SKELTON. *J. Inst. Petroleum Tech.* 15, 443-55(1929).—The stratigraphy and structure in this field (Trinidad) are described. The crude oil is dark green in color, sp. gr. 0.798 to 0.815, distillate up to 150° 32-46% (sp. gr. 0.769-0.771), distillate 150-300°, 49-56.5% (sp. gr. 0.811-0.822), residue 4.5-10.5% (sp. gr. 0.903-0.905). The residue is fluid at 6°F. D. F. BROWN

The technical methods for breaking crude-oil emulsions. A. LOTTERMOSER AND NICOLAS CALANTAR. *Kolloid-Z.* 48, 179 84(1929). cf. *C. A.* 23, 5081.—A résumé of the many methods employed for de-emulsifying crude oil is given in brief. No universal method is known since emulsions behave differently as the result of previous treatment. Drilling and raising of oil, location, transportation, accessibility of emulsifiers and phys. and chem. treatment are the chief factors involved in the breaking processes. R. H. LAMBERT

Determine efficiency of absorber. E. R. COX AND M. L. ARNOLD. *Oil Gas J.* 28, No. 13, 46, 97-8, 101, 105-6(1929).—The aim of this work was to establish a relation between the ratio of oil to gas and the efficiency of absorption when wet natural gas is passed through absorption oil. A formula was derived for the relation, based on the laws of Dalton, Raoult and Avogadro. Operating data furnished by the principal companies who are making natural gasoline by absorption were used to test the formula, which, it was decided from the results, was essentially valid. The following simplification of the formula is sufficiently accurate for calcg. the oil-to-gas ratio necessary to absorb all the $n\text{-C}_4\text{H}_{10}$ from the gas which the particular type of absorber is capable of recovering: calc. or est. the temp. of the oil leaving the absorber. Multiply the vapor pressure of $n\text{-C}_4\text{H}_{10}$ at this temp. by 75, and divide by the working pressure (abs.) expressed in the same units. EMMA E. CRANDAL

Development of insulating oils. C. E. SKINNER. *Electrician* 103, 299-301(1929).—

A review. Through accident discovery was made early in the study of insulating oils that free S would greatly impair their insulating value. C. G. F.

A new method of evaluating alterability of transformer oils. H. WEISS AND T. SALOMON. *Ann. combustibles liquides* 4, 419-36(1929).—The time ("first period") required for production of a trace of deposit insol. in the oil maintained at 114-117° with the oil surface in contact with air is used as an index of the alterability. Oils are classified as *very alterable* (first period of less than 10 hrs.), of (1) *average* and (2) *slight alterability* (those yielding deposits of (1) more and (2) less than 0.008 g./100 cc. of oil in 15-24 hrs.), and *very slightly alterable* (first period of more than 36 hrs.). R. E. SCHAAD

Distribution of sulfur in oil shale. III. E. P. HARDING. *Ind. Eng. Chem.* 21, 818(1929).—The following figures give, resp., the % of S in the shale and the % of the total S that is present as sulfide, as sulfate and as organic: Sao Paulo, Brazil 0.5765, 45.81, 16.06, 38.13; Musselband Seam, Scotland, 0.8819, 65.69, 11.42, 22.89; Elko, Nev., 4.946, 72.62, 8.21, 19.17; Green River, Utah, 1.101, 37.24, 13.26, 49.50; Mount Logan, Colo., 1.373, 46.43, 6.30, 47.27. EMMA E. CRANDAL

Some experiments in burning tar from kauri waste. ARNOLD HANSSON. *New Zealand J. Sci. Tech.* 11, 53-60(1929).—The % of HOAc and MeOH was too small to make the pyroligneous liquor of com. value. The tar contained considerable H₂O, and distn. gave a low yield of oils. The dehydrated pitch was very hard and brittle and gave low yields of light and heavy oils on distn. E. M. SYMMES

Comparison of the McIlhiney and Rosenmund methods in the determination of unsaturated bonds in petrolatums. P. AGOSTINI. *Ann. chim. applicata* 19, 241-53 (1929).—The method of McIlhiney is considered better than that of Rosenmund for this purpose, because substitution products are formed, and the former method distinguishes between addn. and substitution. A. W. CONTIERI

Results of experimental work in sweating slack wax. H. L. KAUFFMAN. *Refiner and Natural Gasoline Mfr* 8, No. 9, 74-6(1929). The phys. treatment given to wax before sweating is a controlling factor. Slow cooling of melted wax before sweating is more advantageous than rapid cooling, as evidenced by higher yields with lower oil-and-moisture content. The yield of scale wax is also increased by slow cooling followed by agitation prior to sweating. J. L. ESSEX

Determination of oil in paraffin wax. D. P. WELD. *Refiner Natural Gasoline Mfr* 8, No. 10, 102(1929).—A review of the disadvantages of all previous methods is given. The A. S. T. M. has adopted as a tentative standard a modification of the old press method, but the method is good only for expressible oil and not total oil. The oil-and-wax mixt. is pressed between two cloth disks at 1000 lb. per sq. in. and 15.5°, then dried at 100° and weighed. No method for detg. the actual oil content of wax is available. J. L. ESSEX

Cup grease manufacturing methods. H. L. KAUFFMAN. *Refiner Natural Gasoline Mfr* 8, No. 9, 106-15(1929).—A large no. of formulas for mfg. cup greases, analyses of greases, characteristics of well-made greases and purchasing specifications are given. J. L. ESSEX

The valuation and cracking of gas oils. R. H. GRIFFITH. *J. Soc. Chem. Ind.* 48, 252-63T(1929).—The aim of this work was to correlate the value of gas oils for gas making with their compn. The method was to measure the thermal value of the gases produced from cracking a given quantity of oil in a stream of H₂ or N₂. A vertical silica tube into which the oil was dropped served as the furnace for the first expts. When therms per gal. of oil were plotted against cc. of oil going through per min., the curve rose abruptly to a max. and then dropped off linearly. When packing sufficient to double the exposed surface was placed in the tube, the curve obtained was somewhat dissimilar, as if the products of surface reaction were not identical with those of gas reaction. The temp. of max. efficiency in gasification was about 750°. H₂ raised the efficiency, as comparative runs with N₂ showed. The H₂ may react with gaseous or liquid hydrocarbons, it may retard the loss of H₂ from the hydrocarbons, and it may react with the products of cracking while the temp. is still sufficiently high. The oils tested were analyzed; the highest thermal yields were from those contg. the highest % of straight-chain compds. Study of tar production required the use of a somewhat larger tube as furnace. As the rate of feeding was increased, the tar yields dropped to a min. almost immediately and remained nearly const. The "paraffin" content of the tar, that is, the % of substances not dissolved by H₂SO₄, was very high at low rates of feed. The pitch or residue after distn. of the tar to 360° increased with the rate of oil feed. Expts. with carburized-water-gas sets, like those with the miniature app., gave the max. of therms produced per gal. of oil while the feed rate was still low. The optimum temp.

could not be known exactly without the facts as to temp. gradient throughout the super-heater and carburetor.

EMMA E. CRANDAL

Commercial gasoline in the Argentine; criticism of analytical methods. ALFREDO D. ROZZI. *Anales oficina quim. provincia* 2, No. 2, 124-65(1929).—A critical review of gasoline-testing methods, in particular those of the U. S. Bureau of Mines, and the current methods for estg. unsatd. aromatic and naphthenic hydrocarbons. A practical aniline-point method for aromatics, etc., is outlined. The 3-hr. sulfur-corrosion test is too rigorous and should be reduced to 2 hrs. A bibliography of 74 references is given. Engler distn. curves are shown for Texas and other gasolines.

EMMA E. CRANDAL

Twentieth semi-annual motor gasoline survey. E. C. LANE, S. S. TAYLOR AND C. J. WILHELM. *Bur. Mines, Repts. Investigations* No. 2959, 12 pp.(1929).—Gasoline sold during the summer of 1929 was slightly more volatile than in 1928 (2°F. general lowering of av. distn. range). Winter gasoline was more volatile than summer fuel in the lower end of the distn. range. Six tables of analyses are given.

ALDEN H. EMERY

Analytical reactions of tetraethyl lead. GRAHAM EDGAR AND GEORGE CALINGAERT. *Ind. Eng. Chem., Anal. Ed.* 1, 221-2(1929).—Pb in concd. or dil. gasoline soln. as alkyl lead is converted to bromide and then detd. either gravimetrically as chromate or volumetrically by the molybdate method. R_4Pb ($R = C_2H_5$), R_6Pb_2 , R_3PbX and their mixts. are detd. by an iodometric method.

ARTHUR FLEISCHER

Flame characteristics of "pinking" and "non-pinking" fuels. II. G. B. MAXWELL AND R. V. WHEELER. *J. Inst. Petroleum Tech.* 15, 408-15(1929); cf. *C. A.* 22, 3038.—As a result of a study of the flames of explosions of mixts. of isopentane, pentane, benzene and other fuels with air in a closed horizontal cylinder it is concluded that 2 conditions are necessary for a "pinking" explosion to occur in a closed vessel. (1) The size and shape of the vessel, the nature and strength of the mixt. and the magnitude and rate of heat liberation in the burning gases must be such that a stationary wave can be set up in the column of gases before the initial flame has traveled throughout the vessel. (2) The nature of the fuel and its concn. in the mixt. must be such that there is sufficient residual energy available to maintain a shock wave when the flame, accelerated by the stationary wave, is arrested by the wall of the vessel. With these assumptions the effect of addn. of "antiknocks" such as $Pb(C_2H_5)_4$ which render the combustion continuous behind the flame front is understandable. Fuels like C_5H_8 and CS_2 , which themselves burn continuously during explosion, act in a manner similar to $Pb(C_2H_5)_4$, but less effectively. The effect of turbulence is probably two-fold. It tends to prevent formation of a stationary wave and it accelerates the combustion in the wake of the flame.

D. F. BROWN

Methods of determination of aromatic hydrocarbons in gasolines produced by straight distillation. M. D. TILICHEEV AND A. I. DUMSKII. *J. Inst. Petroleum Tech.* 15, 405-83(1929); cf. *C. A.* 22, 1674.—Four methods for determining the aromatic content of gasoline are described—(1) The aniline method, (2) the nitrobenzene method, (3) the sp. gr. method and (4) the refractometric method. For the C_6H_6 , C_7H_8 and C_8H_{10} fractions the refractometric method appears to be the simplest and quickest. The method is accurate to $\pm 0.3\%$. For greater accuracy the sp. gr. method is preferable. The aniline or nitrobenzene method should be used for detg. aromatic hydrocarbons in the 150-200° fraction, since the variable compn. and structure of the aromatic hydrocarbons in this fraction do not affect the crit.-soln. temp. as much as they do the sp. gr. or refractive index. The sp. gr. and refractometric methods therefore can be successfully applied only to fractions boiling below 150°. The nitrobenzene method has the following advantages over the aniline method: (1) lower crit.-soln. temp. and therefore more rapid detn., (2) smaller fluctuations of nitrobenzene coeffs. because of the non-aromatic portion, and (3) greater soly. of nitrobenzene.

D. F. BROWN

Economical use of steam in gasoline plants. W. L. RIFENBERICK. *Refiner and Natural Gasoline Mfr.* 8, No. 9, 88, 90, 94, 96, 98, 100, 102, 104(1929).

J. L. ESSEX

Diesel-fuel-oil specifications. HENRY C. DINGER, et al. *Mech. Eng.* 51, No. 10, 765-8(1929); cf. *C. A.* 22, 4783.—In this progress report of an A. S. M. E. Comm. the suggested requirements as they now stand are, for heavy-duty and light, high-speed engines, resp., max. viscosity at 100°F., 200 sec., min., 45 sec., max. 100 sec.; S, max., 3%, 2%; Conradson C, max., 5%, 1%; ash, max., 0.08%, 0.02%; flash, min., 150°F.; moisture and sediment, max. 1%, 0.5%.

EMMA E. CRANDAL

Viscosity of Diesel-engine fuel oil under pressure. MAYO D. HERSEY. *Natl. Advisory Comm. Aeronautics Tech. Notes* No. 315, 8 pp.(1929); cf. *C. A.* 22, 2052.—It is necessary to know the effect of the high pressure upon the viscosity of fuel oil to be injected into Diesel-engine cylinders. Detns. of viscosity of a Diesel fuel oil, sp. gr. at 20° 0.864, were made in the ball- and slanting-tube app. used for the work described in *C. A.*

22, 2052. The fuel oil was less viscous than the lubricating oil previously tested; hence a larger ball was used, with smaller radial clearance. This lengthened the roll time and made possible greater accuracy of readings. The finding of the abs. viscosity is based on the equation $ST = U/S$. S = the sq. root of the ratio of density of ball to density of oil, minus 1. T is roll time. U is the kinematic viscosity, or the abs. viscosity divided by density. The density of the oil can be calcd. as a function of temp. and pressure. A calibration curve for which ST was plotted against U/S was obtained for the viscometer by detg. the roll times for five liquids whose viscosity at atm. pressure was known; MeOH, H_2O , kerosene, the Diesel fuel oil and a white mineral oil. Roll times for the fuel oil could then be taken for pressures up to 12,000 lb./sq. in., and abs. viscosity found from the chart. At 22.6° the abs. viscosity of the fuel oil rose from 0.0563 poises at atm. pressure to 0.284 at 12,000 lb. pressure. Isopiestic were plotted over the temp. range 20° to 120°; and isothermal curves for pressures up to 12,000 lb.

E. E. C.

Gilsonite and related bitumens. I, II. H. M. LANGTON. *Ind. Chemist* 5, 324-6, 383-6(1929).—The properties of the natural bitumens are classified. L. confines the article otherwise to the asphaltites (gilsonite, glance pitch, grahamite and manjak). Part I describes the occurrence and mining of gilsonite in Utah. Part II discusses the effects of shipping practices on gilsonite, its grading into "selects" and "run-of-mine," the properties of these 2 grades, and the uses of gilsonite in the manuf. of paints, varnishes and japans, in elec. insulation and in ink manuf. The occurrence, properties and uses of glance pitch, grahamite and manjak are covered in moderate detail. Bibliography.

E. G. R. ARDACH

The bituminous sandstone of Pointe-Noire (French Equatorial Africa). V. BABET. *Ann. combustibles liquides* 4, 65-8(1929).—On extrn. by C_6H_6 and $CHCl_3$ the sandstone yields 15.5 and 16%, resp., of bitumen, d. 1.053, m. 48°. Slow distn. of the bitumen with $ZnCl_2$ gives 62% by wt. of liquids and a residue of C.

R. E. SCHAAD

Determination of the flash point of lubricating oils. JOSEF ŽD'ARSKÝ. *Chem. Obzor* 4, 219-20, 252-9(259 English)(1929).—Agreement with results obtained by using the Marcusson app. can be obtained by an app. provided with an ignition device with a small horizontal flame which when the burner is turned down comes within the crucible rim. The following precautions must be observed: a porcelain or metallic crucible 40 mm high and of 40 mm. diam inside is filled with cylinder oil up to a mark 15 mm. below the rim, or, with other oils, up to a mark 10 mm. below the rim; the app. is then fixed in the center of the app., clamped, and surrounded by coarse sand up to the level of the oil surface. Heating should be so regulated as to obtain a regular increase of temp. of approx. 2-3° per min. in the neighborhood of the flash point. The small flame must be adjusted to a length of 10 mm. The oil should be tested at intervals of 1°. The thermometer used should be standardized.

JAROSLAV KUČERA

Carbon deposits from lubricating oils. Experiments with heavy-duty engines. C. J. LIVINGSTONE AND W. A. GRUSE. *Ind. Eng. Chem.* 21, 904-8(1929).—Trials of a paraffin-base oil giving normally high Conradson C residue, a highly refined paraffin-base oil of low C residue, and a naphthene-base oil, were made in a fleet of sleeve-valve motor-coach engines. The results were studied in conjunction with previous C-residue tests upon oils in a poppet-valve lab. engine. Conclusion: While the C-residue test answers for paraffin-base oils to be used in poppet-valve engines, a better requirement for oils to be used in a sleeve-valve engine would be a distn. standard. For instance, it might be specified that 90% of a naphthene-base oil be volatile at 10 mm. pressure and distil over between 550° and 750°F.

EMMA E. CRANDAL

Reaction between lubricating oils and phosphorus pentoxide. C. C. FURNAS. *Ind. Eng. Chem., Anal. Ed.* 1, 185(1929).—Yellow P was used to exclude air from a system in which heat-transfer expts. were being made. P_2O_5 dust formed reacted with the lubricating oil on the vanes of the blower used and formed a thick, sticky, reddish brown gum. The gum could be dissolved out in H_2O and then did not reform.

EMMA E. CRANDAL

The "wet carbonization" of wood and sulfite waste liquors. CARL G. SCHWALBE. *Papier-Fabr.* 27, 300-11(1929).—An address. A process (cf. C. A. 22, 1035) is outlined by which wood is heated to 135° in a concd. $MgCl_2$ soln. Yields obtained resp. by customary dry distn. and wet carbonization are from softwood: charcoal, 30, 55%; HOAc, 2 and 6%; MeOH, 0.6 and 1.2%; and oil — and 2%; from hardwoods: charcoal 30 and 55%; HOAc, 4.3 and 10%; MeOH, 1.5 and 1.2%. No Me_2CO is obtained in the wet process. The same process is applicable to concd. sulfite pulp waste liquors, except that bark charcoal is added to start the decompn. and also that if the sulfite liquor has been fermented and distd., the greater part of the lime must be pptd.

with H_2SO_4 . The yields obtained from 1 cu. m. of liquor are: charcoal, 70 kg.; MeOH 0.7 kg.; furfural and oil, traces. The charcoal in this case is obtained in a form which can readily be removed by filtration. The heating values of the charcoals are: wood, dry distn., 8000 cal.; wet process, 6800 cal.; sulfite liquor, 4800 cal. R. H. DOUGHTY

Glycerol index of turpentine. M. H. BARRAUD. *Mat. grasses* 21, 8514-6(1929).—An emulsion of turpentine and glycerol shows irisations when looked through in front of a luminous background (Christiansen phenomenon). A color change from blue to violet is produced on heating. The temp. of change is affected by the compn. of the turpentine. Adulterants such as C_6H_6 and MeOH also affect the temp. of change. This method is applicable only when the same types of trees are compared. P. T.

The significance of the hydrogen content of charcoals. H. H. LOWRY. *J. Phys. Chem.* 33, 1332-42(1929); cf. *C. A.* 18, 2094.—Equations are given to express results obtained on the H content of charcoals made by heating coals at temps. from 800° to 1500° for various lengths of time. The H content was not affected by the atm. in which carbonization was carried out, whether H_2 , air or CO_2 . T. H. CHILTON

Fuel efficiency tests on batch oil stills (KREISINGER, *et al.*) 21. Lubricants for paper mills (STEINITZ) 23. Oil analysis (KETTLE) 27. New petroleum by-product: octane-sultone (BALDESCHWIELER, CASSAR) 10. Hydrogenating carbonaceous materials (U. S. pat. 1,730,997) 21. Filter for oil (U. S. pat. 1,730,581) 1.

Petroleum distillation and fractionation system. EUGENE H. LESLIE and EDWIN M. BAKER. U. S. 1,730,891, Oct. 8. An app. with a fractionating column, and various details of procedure are described.

Olefins from mixed petroleum products. ROBERT M. ISHAM (to Seth B. Hunt, trustee). U. S. 1,729,782, Oct. 1. Mixed products such as oil gas are treated, at 20°, under sulfating conditions (suitably under pressure) with an acid menstruum comprising a H_2SO_4 deriv. of an unsatd hydrocarbon substantially free from active constituents other than alkylsulfuric acids, *e. g.*, with EtHSO_4 and PrHSO_4 , in order to sep. olefins. The residual gas may be further scrubbed with 93.2% H_2SO_4 at about 80°.

Treating hydrocarbons with alginic acid. LAURIE L. BURGESS (to Plastic, Inc.) U. S. 1,729,993, Oct. 1. By the reaction of alginic acid upon a hydrocarbon material such as paraffin in CCl_4 soln., a product is obtained which is suitable for use as a *waterproofing compn.*

Apparatus for distillation and condensation of hydrocarbon oils. JOHN E. BELL (to Sinclair Refining Co.). U. S. 1,730,350, Oct. 8. Various structural details are described.

Hydrogenating and purifying mineral oils, etc. MAX HOFSAß (to Internationale Bergin-Compagnie voor Olieën Kolen-Chemie). U. S. 1,729,943, Oct. 1. Mineral oils, crude naphthalene, oils from coal, etc., are subjected to the combined action of H and Na under pressure and at a temp. of at least 300°. Cf. *C. A.* 22, 3773.

Electrical heating system for oil stills. ARMAN E. BECKER and JACKSON R. SCHONBERG (to Standard Oil Development Co.). U. S. 1,730,112, Oct. 1.

Recovery of gasoline hydrocarbons from gases. WARREN K. LEWIS (to Standard Oil Development Co.). U. S. 1,730,152, Oct. 1. The gas is introduced at an intermediate point of a gas and liquid contact zone and an absorption liquid such as mineral seal oil which is substantially non-volatile under the prevailing conditions and miscible with the condensible hydrocarbons is introduced above the gas inlet and in part at least near the top of the gas and liquid contact zone; intermittent countercurrent contact of the gas and liquid is effected, and the contact zone is cooled near its top and heated near its bottom. Various structural details of app. are described.

Filter for gasoline, etc. HENRY E. PELLETIER (to Pelco Auto Products, Inc.). U. S. 1,730,475, Oct. 8. Structural features.

Strainer for gasoline or other liquid fuels. CHARLES W. FISHER (to Alomite Corp.). U. S. 1,730,360, Oct. 8. Structural features.

Lubricant. HOWARD DIMMIG. U. S. 1,729,823, Oct. 1. Pb oleate is dissolved in a mineral lubricating oil to form a liquid lubricant which is suitable for use as a "car oil," for lubricating journals, etc.

Filtering lubricating oil of internal-combustion engines. FRED W. MANNING (to Stewart-Warner Corp.). U. S. 1,729,746, Oct. 1. An app. is described comprising a magazine filter arranged for removal of contaminated filtering material in direct ratio with the introduction of new oil.

23—CELLULOSE AND PAPER

CARLETON E. CURRAN

Review of cellulose chemistry developments. J. L. PARSONS. *Paper Trade J.* 88, No. 21, 73-4 (1929).—A review of the activities of the comm. on methods of analysis of the Cellulose Division of the Am. Chem. Soc., together with a description of the method proposed by it for the detn. of α -cellulose. A. PAPINEAU-COUTURE

Characterization of celluloses. T. LIESER. *Cellulosechemie* 10, 21-7 (1929).—Innumerable natural and artificial celluloses are believed to exist each with different phys. and chem. properties, and all natural cellulose fibers to contain many chemically different celluloses; a chem. method, based on viscose formation, for their differentiation is described. At a certain sp. concn. of NaOH, which at a given temp. varies with the form of the cellulose, a compd. of the type $2C_6H_{10}O_5 \cdot NaOH$ is formed, the formation of which is characterized by the possibility of undergoing the viscose reaction. Thus, natural cotton cellulose forms this compd. only with at least 16-18% NaOH soln., while Cellulose-A (pptd. from concd. HCl soln.) requires only a 7.5% soln. There exists a whole range of intermediate celluloses which form compds., and, in consequence, undergo the viscose reaction, with increasingly lower concns. of alkali. Thus, if the % of the sample undergoing the viscose reaction is plotted against the concn. of alkali, a series of different curves are obtained with different types of celluloses. When natural cotton cellulose is treated with alkali of increasing concn., above 2 N the proportion undergoing the viscose reaction increases with increasing alkali concn. until it is complete at 5 N. Lignocellulose gives the viscose reaction at lower alkali concn., while with artificial silk the proportion of viscose formed increases rapidly at concns. of alkali above N. In the practical application of the method for the differentiation of cellulose and for the detection and detn. of Cellulose-A (which is useless for the prepn. of artificial silk), excess of alkali must be avoided, just sufficient being added to 1 g. of the cellulose to moisten all the fibers. After 1 hr. at 21°, 0.5 cc. of CS_2 is added and the viscose formation allowed to proceed in the thermostat. After diln. with water the insol. residue is filtered through a hardened paper and washed until the filtrate gives no ppt. with mineral acids. The residue is then washed with 0.5 N HCl, dried at 103° and weighed. A number of typical results with various types of cellulose are given. B. C. A.

Substances accompanying cellulose. I. F. W. KLINGSTEDT. *Biochem. Z.* 202, 106-14 (1928).—Cellulose preps. (sulfited cellular material of pine wood) can be completely freed from pentosans by treatment with sufficient 17-18% NaOH for 1 hr. With 6% NaOH, the first treatment of crude cellulose removes about half of the pentosans, and 90% is removed by 2 treatments. Saturated baryta at 50° removed only about one quarter of the pentosans. The cellular material obtained from rye straw by successive chlorinations contains large amts. of pentosans, which can be removed by treatment with 17% NaOH. B. C. A.

Tensile strength and elongation of continuous cellulose fibers. JAN KALFF. *Rec. trav. chim.* 48, 997-1004 (1929).—Samples of viscose and cuprammonium fiber were tested for tensile strength and breaking elongation on a machine of the Schopper type. Details of methods are not given, though representative data are submitted to show that the detn. should be carried out at a speed such that max. strength is obtained. The speed of the machine should be indicated in terms of percentage extension per mm. The breaking elongation of viscose is independent of the duration of the detn., while the cuprammonium fiber shows a higher elongation the greater the speed of the Schopper machine. Shorter's theory of the compn. of wool fibers (cf. C. A. 18, 2253) is applied to artificial silk. S. B. FOSTER

Determination of cellulose and amount of chlorine consumed in its isolation. MARK W. BRAY. *Ind. Eng. Chem., Anal. Ed.* 1, 40-3 (1929).—A new modification of the Cross and Bevan method utilizing a simplified type of Roe's app. (cf. C. A. 18, 2808) is described. The method offers more rapid and complete chlorination, less degradation of the cellulose, and elimination of the factor of particle size. F. A. S.

Determination of α -cellulose. GRO. J. RITTER, et al. *Ind. Eng. Chem., Anal. Ed.* 1, 52-4 (1929).—Four methods were compared by the A. C. S. Committee and one recommended as standard. Details of each method are given. F. A. SIMMONDS

The determination of α -cellulose. ERWIN SCHMIDT. *Papier-Fabr.* 27, 249-51 (1929). The effect of diln. after mercerization, and of washing with 8% NaOH, has not been sufficiently emphasized. The temp. of the wash soln. is more important than that of the mercerizing soln. The time of washing must be accurately controlled, since

the α -value decreases rapidly with increased time (cf. Bergqvist, C. A. 23, 3079).

R. H. DOUGHTY

The determination of α - and β -celluloses. RAGNAR BERGQVIST. *Papier-Fabr.* 27, 119-23; *Pulp Paper Mag. Can.* 28, 515-6, 548, 550(1929); cf. C. A. 22, 1678; 23, 3079.—Experience with the Jentgen method (cf. Schwalbe, C. A. 22, 4800) indicates that this should not be considered as one affected by large exptl. errors; by proper and careful manipulation results checking within 0.1% should be consistently obtained. Representative data are cited leading to the following recommendations: (1) A sample of 10 g. should be used, as this will be more truly representative than a smaller one; weighings should be carefully made, and the drying oven accurately controlled. (2) The mercerization should be carried out at 20°; if a thermostat is not available a correction of 0.1% per degree should be applied to the α value, being subtracted if the temp. is above 20° or added if it is below this value. The same correction applies in the opposite sense to the β value; the γ value is independent of the temp. The wash water in any case should be kept close to 20°. (3) The amt. of water used for diln. should be kept const. at 300 cc. (4) Filtration must be begun at once after diln., and completed as rapidly as possible; by using a linen cloth filter in a Buchner funnel filtration and washing may be completed in 5 to 10 min. (5) Mech. treatment (kneading, of fiber with mercerizing soln.) should be brief, not exceeding 5 min. Immediate and rapid filtration and washing is by far the most important single factor. Thus, parallel samples were treated with 50 cc. and 200 cc. of mercerizing soln. When treated as under (4), the α values were, resp., 87.36 and 87.30%, while, when a 5 min. interval intervened between diln. and filtration, they were 87.38 and 86.32%.

R. H. DOUGHTY

Celluloses of some Australian plants. WILLIAM G. ARNEMAN AND JOHN C. EARL. *J. Proc. Roy. Soc. N. S. Wales* 63, 44-6(1929).—Celluloses from all sources are not identical since acetylated celluloses from 2 woods, 5 water and 1 saline plant had optical rotations ranging from $[\alpha]_D = -20.1^\circ$ to $[\alpha]_D -39.9^\circ$. One was optically inactive.

F. A. SIMMONDS

Cellulose from cereal straws. S. D. WELLS. *Ind. Eng. Chem.* 21, 275-8(1929).—Pure pulps in high yield can be produced from cereal straws by relatively mild chem. treatment. The use of dil. NaOH, Na_2CO_3 with and without S, $\text{Ca}(\text{OH})_2$ and Cl_2 with wheat straw is described. Fifteen % of xylan can be extd. from straw with dil. NaOH and 9% of furfural-yielding compds. by chlorination followed by NaOH extn. The spent cooking liquors from Na_2CO_3 -S cooking yield lactic acid, AcOH, etc., on hydrolysis, fermentation, etc.

C. E. CURRAN

The estimation of cellulose in wood. J. H. ROSS, A. L. DAVIDSON AND R. O. HOUGHTON. *Pulp Paper Mag. Can.* 27, 925-6(1929).—The method is based, like the Cross and Bevan method, on chlorination of the non-cellulose constituents and on soln. of the chlorination products in an alk. soln.; HClO is used instead of Cl gas, and NH_3 water instead of Na_2SO_3 soln. The proposed method of procedure is described in detail. The cellulose thus obtained is not a pure cellulose but is equiv. to the type and amt. obtained from wood chlorination with Cl gas. To est. the resistant cellulose, reflex the residue with 1% NaOH soln. for 1 hr., wash with water, AcOH and water, dry and weigh. The method may be modified to include either extn. with 1% NaOH for 2 hrs. at water bath temp., or extn. for 6 hrs. with 1% NaOH at the b. p. prior to chlorination. When applied to purified cotton cellulose the method produced no loss of cellulose and only an insignificant reduction in resistant cellulose.

A. P.-C.

A standard method for determining the viscosity of cellulose in cuprammonium hydroxide. E. K. CARVER, et al. *Ind. Eng. Chem., Anal. Ed.* 1, 49-51(1929).—The method and app. are described in detail. A falling sphere viscometer and a special viscosity pipet for high and low viscosities, resp., are used.

F. A. SIMMONDS

Effect of chemical agents, especially oxidizing agents, on the behavior of cellulose. P. WAENTIG. *Cellulosechemie* 10, 81-5(1929).—Cellulose isolated from natural fibers, compared with purified standard cotton, shows a diminished resistance to chem. attack due to insufficient removal of impurities and unavoidable chem. attack on the cellulose, though improvement in the purification processes results in more resistant cellulose. Chem. action differentiates the following cellulose classes: (1) purified celluloses from natural cellulose compds., (2) cellulose regenerates prepd. from cellulose esters and ethers, (3) alkali-sol. celluloses formed by strong acid action, (4) chem. degradation products of cellulose having new chem. properties. In addn., the following phys. characteristics in the light of the micellar theory may be added: Purified cellulose is characterized by a fibrous structure, distinguished by regular arrangement of anisotropic micelles of crystallites, and possesses a relatively high resistance to swelling. Swellable regenerated cellulose, is characterized by a disorientation, perhaps also by an amorphiza-

tion of the micelles, which explains its increased swelling capacity. Alkali-sol. cellulose corresponds to a comminution of the crystallites or micelles through intramol. degradation. With each disorientation or amorphization of the crystallites the intramolecular, the intramol. degradation, or both, take place. In all cases in which the particle degradation is assumed, disorientation has already proceeded and hydrolytic degradation products are present. Accordingly, the cellulose fiber is simultaneously decompd. physically and chemically, but the former to a greater degree. Particle degradation in "hydro-" and "oxycellulose" is evidenced by increased alkali soly. of unchanged cellulose and by decrease in the viscosity of its solns., as nitrates, xanthogenates and cuprammonium compds. Ripening of viscose is accompanied by oxidation through the absorption of atm. O and is evidenced by the typical oxycellulose particle degradation characteristics above mentioned. The presence of metals accelerates the ripening of viscose because of the fact that they act as O carriers in cellulose oxidation. NaOH has no effect on particle comminution as shown by the effect of mercerization in which the strength of α -cellulose content of the material is not reduced. Particle comminution, which is tied up with cellulose oxidation, takes place in cuprammonium solns. through the catalytic action of the Cu. Xanthate solns. prepd. from cotton linters have higher viscosities than those prepd. from pulp. Although this has been explained by assuming that the linters have a higher "micelle mol. wt." than pulp, the influence of outside agencies included in the method of isolation, bleaching or purification may explain the difference. W. further discusses the effect of mech. action, such as beating or cutting of the original cellulose, on the viscosity of its viscose or nitrate solns. and on the changes in valence due to oxidation.

L. C. FLECK

Oxidation of alkali cellulose by aging and its importance in the manufacture of rayon. G. KITA AND I. SAKURADA. *Cellulosechemie* 10, 113-20(1929).—Alkali celluloses aged in the steeped and in the pressed-out condition are compared. Although both are oxidized by the action of air the oxidation products in the steeped material are dissolved by the NaOH and removed, whereas in the pressed-out material they remain in the mass and are used in the subsequent prepn. of viscose. The effects of aging for different lengths of time, of aging in an atm. of air or of H_2 , of the time of steeping, etc., on the Cu no. and spinning properties of the fibers are discussed and certain differences in spinning properties, viscosity and surface tension of viscoses obtained from alkali cellulose prepd. in different ways are described. An increase of Cu no. results on aging regardless of whether done in closed or open atm. of air or in H_2 . In general, however, there is little difference between the properties of viscoses prepd. from pressed and from steeped alkali-cellulose. In a closed atm. of air the viscosity of the viscose decreases as the time of aging or the temp. is increased, the fibers are thicker and the ripening necessary to give a spinnable product is increased. Aging in H_2 is slower than in air but the product is more viscous, spins more easily and gives stronger fibers. Under certain conditions long steeping followed by a short aging period yields fibers as strong as those obtained by aging in H_2 , and good fibers can also result by aging for a short time only in a closed atmosphere of air.

C. E. CURRAN

The oxidation of alkali cellulose with gaseous oxygen. III. WILHELM WELTZIEN AND GERHARD ZUM TOBEL. *Seide* 32, 371-7, 414-7; *Chem. Zentr* 1928, I, 2080; cf. C. A. 22, 4795.—Cotton and Cu-silk are oxidized at 60° by means of O_2 , the speed of the reaction depending upon the concn. of the alkali. A moderate concn. is best. For each atom of absorbed O approx. 1 mol. of alkali is used up. CO_2 is formed in the ratio of $1 CO_2:2O_2$. In an atm. of O_2 there is a const. increase in the alkali soly., yet the cellulose splits off no cleavage products.

C. R. FELLERS

Fractional precipitation of cellulose acetate and some properties of the fractions. J. G. McNALLY AND A. P. GODBOUT. *J. Am. Chem. Soc.* 51, 3095-3101(1929).—A sample of com. Me_2CO -sol. cellulose acetate was fractionally pptd. by addn. of dil. Me_2CO or H_2O . The fractions have the same chem. compn. but different phys. properties (m. p., viscosity); this is attributed to a difference in the state of aggregation of the glucose anhydride units in the micelles. The soly. of cellulose acetate in org. liquids is shown to be a function of its state of aggregation as well as its Ac content.

C. J. WEST

Primary and secondary cellulose acetates. H. PRINGSHEIM AND E. SCHAPIRO. *Cellulosechemie* 9, 80-2(1928).—Methods are described for converting the acetone-insol. primary cellulose acetate into acetone-sol. secondary acetate, the change being ascribed to disaggregation of the primary compd. The % yield and soly. in Me_2CO of the product obtained by heating the primary acetate with tetralin vary with the time and temp. of heating, the product being a crumbly mass. The secondary acetate is produced by shaking the primary substance in the cold, keeping it several days in

the cold or heating it with benzenesulfonic acid. Changes in AcOH content, soly. in Me_2CO , viscosity and film-forming power under different exptl. conditions are discussed. B. C. A.

Note on the work of K. Werner and H. Engelmann. "Some properties of acetone-soluble acetylcellulose." H. E. FIERZ-DAVID AND WERNER. *Z. angew. Chem.* **42**, 825-6(1929); cf. *C. A.* **23**, 4569.—Polemical. C. E. CURRAN

The behavior of cotton towards glycol and glycol-hydrochloric acid. B. RASSOW AND F. WEBER. *Papier-Fabr.* **27**, *Fest- u. Auslands-Heft*, 88-9(1929).—The α -cellulose from cotton is not attacked by heating with glycol for 37 hrs. at 190° or by 4 hrs. heating in a bomb-tube at 210° . The fibers, however, swell and become more sensitive to attack by other reagents, and the hemicelluloses and pentosans remaining after the usual purification treatment are dissolved. If small amts. of HCl are added to the glycol, these impurities are removed more rapidly, but at the same time the α -cellulose is converted to hydrocellulose. This hydrocellulose is characterized by a low Cu no., due to soln. of the impurities by the glycol-HCl. Microscopic examn. of the fibers shows that they are split in directions perpendicular to the axis. From the properties of the hydrocellulose and viscosity measurements, it appears that the glycol-HCl causes depolymerization of the cellulose mols. R. H. DOUGHTY

Storage properties of transparent celluloid. The causes and progress of its deterioration and the discrimination of samples as to stability in storage. O. C. ILLINGTON. *J. Soc. Chem. Ind.* **48**, 267-76T(1929).—Fourteen specimens of transparent celluloid of British, U. S., German, French, Swiss and Japanese manuf. were ground, and the coarse grinding (passing 0.084" hole) and fine grinding (passing 0.032" hole) were analyzed for (1) volatile matter, (2) nitrocellulose, (3) urea, (4) camphor, (5) sulfates, (6) cellulose sulfate, (7) N in nitrocellulose, (8) whether camphor was natural or synthetic, (9) viscosity in acetone + water, (10) puffing point, (11) time required for puffing at 160° , (12) small-vessel test at 100° , (13) Abel test at 82° , (14) surface acidity. The methods employed are described and results discussed at some length. The results of storage trials in a well-ventilated oven at 60° are discussed in relation to the analyses. Urea is shown to have a marked stabilizing effect on celluloid made from impure ingredients (contg. cellulose acid sulfate), but such celluloid did not with stand storage tests as well as celluloid made from well-stabilized nitrocellulose and contg. relatively little urea. Emphasis is laid on the desirability of using only pure ingredients in celluloid. Rapid tests for the discrimination of transparent celluloid as to stability are described. The behavior of celluloid during the late stages of its deterioration is discussed. E. G. R. ARDAGH

The absence of galactan in the skeleton-substance incrusting the cell wall. ERICH SCHMIDT, MATHIAS ATTERER AND HANS SCHNEGG. *Cellulosechemie* **10**, 126-34(1929).—It was previously shown (*C. A.* **21**, 1829) that in spruce and flax the hemicellulose (dissolved by 5% NaOH soln. from the cellulose-hemicellulose complex) contains no *d*-galactose, it being concluded that galactans are lacking in the skeleton-substance of these two plant cells. The present work supports this conclusion by examn. of 7 plants. That Na_2SO_3 is not a sp. solvent for *d*-galactose was detd. by substituting NaHSO_3 , resorcinol and pyridine solns., which gave *d*-galactose-free skeleton-substance. Furthermore, the material isolated at varying H-ion concns. (p_H 4.3, 6.8 and 9.2) yielded no galactose on hydrolysis. Care was also taken to eliminate auto-fermentation. Details of methods of prepn. and analysis are given, and numerous references, especially relative to fermentation as a means of identifying sp. sugars. OSCAR T. QUIMBY

Action of alkali and carbon disulfide on xylan. E. HEUSER AND G. SCHORSCH. *Cellulosechemie* **9**, 93-100(1928).—Treatment of xylan with 4-14.5% NaOH soln. and pptn. and washing the Na compd. 3 times with 20 cc. of 96% alc. (cf. Karrer, *C. A.* **16**, 644) yield an alkali xylan contg. the same proportion of Na; the value closely approximates that required by the compd. $(\text{C}_6\text{H}_5\text{O}_4)_2\text{NaOH}$, the alkali being detd. by titration or, for more trustworthy results, as Na_2SO_4 . Further washing with 96% alc. reduces the Na content since the compd. decomposes: $(\text{C}_6\text{H}_5\text{O}_4)_2\text{NaOH} \rightleftharpoons (\text{C}_6\text{H}_5\text{O}_4)_2 + \text{NaOH}$. In the case of cellulose a compd. contg. the theoretical proportion of Na is formed only with alkali concns. between 15 and 30%; at lower concns. the proportion of Na in the product increases with increasing concn. of NaOH soln. employed. Washing the alkali xylan with water causes a rapid decrease in the Na content, while with varying concns. of alc. the loss of alkali is more rapid the more dil. the alc., the Na content tending to reach an equil. value. Washing with MeOH or glycol gives results intermediate between those obtained with water and alc. A resinous product is obtained by the action of cold alc. on xylan treated with 20% NaOH, or of alc. at 70° on xylan treated with 12% NaOH soln. Similar treatment of xylan with

Na_2S soln. and washing until the filtrate is free from S give a product, the Na and S content of which varies according to the concn. of the alkali sulfide soln. used. With KOH the theoretical compd. is obtained only with more concd. alkali (8–12%), and then, like the Na compd., the K content decreases if washed more than 3 times with alc. The Li compd. is more stable and requires 10 washings to remove the excess of alkali, while the Rb compd. is stable only to 4 washings. Treatment of the unwashed alkali xylan (contg. excess of alkali) with CS_2 yields a "xylan viscose," the viscosity of which, unlike that of cellulose viscose, decreases only slightly with time and is not coagulated after keeping for 1 mo. A product free from combined Na and S compds. is obtained by neutralizing the "viscose" with dil. AcOH , pptg. and triturating the product with alc., washing with ether and drying over P_2O_5 . The proportion of S in the product so obtained varies slightly with the period of treatment with alkali and CS_2 , but is always much lower than that required by any of the possible cellulose xanthates, and, moreover, the proportion of Na and S present is less when xylan free from Cu salts and ash is used. Hence, the formation of "xylan viscose" does not depend on xanthate formation, but involves merely a dissoln. of Na and S compds. in the xylan. The action of alkali on xylan involves a chem. (hydrolysis) and not a phys. degradation, since the proportion of xylan in the "viscose" compd. detd. as furfuraldehydophloroglucide is much less than that estd. from the C content detd. by oxidation with $\text{K}_2\text{Cr}_2\text{O}_7$ and H_2SO_4 . Xylan regenerated from the "viscose" obtained by long standing with alkali and CS_2 has a lower C and a higher H content than the original xylan. *Ibid* 109–19.—The trustworthiness of 2 methods for the detn. of C, (1) oxidation with chromic and phosphoric acids and direct measurement of the vol. of CO_2 evolved (cf. Berl and Innes, *C. A.* 3, 2149), (2) oxidation with an excess of $\text{K}_2\text{Cr}_2\text{O}_7$ and H_2SO_4 and detn. of the excess $\text{K}_2\text{Cr}_2\text{O}_7$ by titration, was tested on pure Na oxalate. In this case the former method gave better results, but with xylan the results obtained by this method varied as much as 10% from the theoretical value. Better results (2% error) are obtained, in the case of xylan, by the titration method when the following conditions are fulfilled: The xylan is oxidized with 33.3–66.6% excess of $\text{K}_2\text{Cr}_2\text{O}_7$ soln. (90 g. p. 1.) in a soln. contg. 20–25 vol.-% of concd. H_2SO_4 with addn. of several drops of Hg by heating for 3–5 min. After cooling, an excess of ferrous ammonium sulfate soln. is added and the excess titrated with 0.1 N KMnO_4 soln. B. C. A.

Degree of swelling of hydrated cellulose (artificial silk). O. FAUST. *Cellulosechemie* 9, 74 5(1928).—Changes in the length of artificial silk fibers on immersion in water and in NaOH solns. show that the degree of swelling decreases with increasing temp., the difference being greater the higher the concn. of NaOH. The degree of swelling, as detd. by length measurements, is lower in H_2SO_4 solns. than in water. B. C. A.

The chemistry of viscose. G. KITA AND R. TOMIHISA. *Cellulosechemie* 10, 134–41 (1929); cf. *C. A.* 23, 5039–40.—The following reactions take place simultaneously in the formation and ripening of viscose: (1) formation of xanthate by the action of CS_2 on alkali cellulose; (2) formation of Na_2CO_3 and Na_2CS_3 by the action of CS_2 on free alkali. It is probable that the first reaction product is not as stable as the second, and as CS_2 and NaOH are consumed, xanthate, which has formed, is decomposed. The reaction continues until an equil. between xanthate, Na_2CO_3 , Na_2CS_3 , etc., is established and all NaOH is consumed. The viscose coagulates by the accumulation of the salts which are formed. Increasing the temp. favors NaOH and CS_2 consumption. Accordingly, xanthate formed at higher temp. decomposes more quickly. The reason for spontaneous coagulation of viscose has not been well understood and Cross and Bevan's theory that coagulation only takes place when xanthate has broken down to contain $\frac{1}{2}$ mol. CS_2 and NaOH to 1 mol. $\text{C}_6\text{H}_{10}\text{O}_4$ has been commonly accepted. These facts do not stand in the case where 18% NaOH soln. and 50% CS_2 are used. Coagulation does not depend on the compn. of xanthate but is caused by the disappearance of free NaOH. Viscose coagulates when its xanthate contains 0.5 mol. combined alkali. Cross and Bevan, Ost, Wyss and others hold that the xanthate first formed gradually decomposes into CS_2 and NaOH. K. and T., however, find that the formation of Na_2CO_3 and Na_2CS_3 does not always take place as a result of xanthate decompn. Xanthate is formed at low temp. Only decompn. of xanthate is observed at room temp. Accordingly, it is not rational to assume that completely formed xanthate is a compd. of 1 mol. NaOH and CS_2 to $\text{C}_6\text{H}_{10}\text{O}_4$. The investigations show xanthate decompn. on ripening and do not explain ripening only by colloidal changes. By using larger amts. of NaOH and CS_2 than specified in the Cross and Bevan process, the alkali combined in xanthate can be increased above $\frac{1}{2}$ mol. In one case 0.8 mol. was combined. L. C. FLECK

* Attempts to cheapen rayon by wet treatment. W. A. DYES. *Kunstseide* 11, 187-93, 217-25(1929).—A review of recent patents. FREDERICK C. HAHN

Chemical composition of wood in relation to physical characteristics—a preliminary study. H. E. DADSWELL AND L. F. HAWLEY. *Ind. Eng. Chem.* 21, 973-5(1929).—Tough and brash specimens of Douglas fir of approx. the same sp. gr. with no apparent structural differences showed only slight divergences in chem. compn., the lignin content of the brash sample being higher than in the tough. In white oak the differences were pronounced, *viz.*, much less Cross & Bevan cellulose and more lignin in the brash sample. Compression wood, "Rotholz," of Sitka spruce, which showed brash failures in cross-bending tests contained also distinctly more lignin and less cellulose than normal wood. Furthermore, compression wood of redwood had, in discrepancy with normal conditions, higher lignin content in the summerwood than in the springwood. The results are as yet insufficient to draw any definite conclusion on the relations between chem. compn. and phys. properties. J. WIERTELAK

The problem of future wood supply. W. SCHMID. *Papier-Fabr.* 27, 69-73(1929).—Careful forest management, release of wood now used in building trades by substitution of metals, and utilization of fast-growth tropical woods may serve ultimately to relieve the threatened pulp-wood shortage. R. H. DOUGHTY

The utilization of cheap and waste woods. C. G. SCHWALBE. *Papier-Fabr.* 27, 523-4(1929).—General. The conception of "waste" wood varies in different industries; most wastes can be utilized for some form of product by the pulp-producing industries. R. H. DOUGHTY

The methoxyl content in the lignin and cellulose decomposition of wood. RICHARD FALCK AND WERNER COORDT. *Ber.* 61B, 2101 6(1928).—The —OMe and lignin contents of pine affected with red rot, "corrosion" in pine beams having dry rot (*Merulius rot*), and "destruction" of various stages were detd. The —OMe content (% by wt.) of wood with no and with various degrees of red rot was practically const., whereas increased stages of dry rot caused increased %'s of —OMe. Detns. of the —OMe contents of the woods after extn. with alc-benzene mixt. (1:1) and of the exts. showed that with increasing stages of red rot there was a very slight decrease of —OMe in both the wood and ext., while with increasing stages of dry rot there was an increase of —OMe in both the wood and ext. in % by wt., but a decrease in —OMe in the wood in % by vol. Assuming that alc-benzene extd. wood contains only lignin bound —OMe, the —OMe contents of the extd. wood and isolated lignin should correspond. However, since the —OMe content of the lignin obtained by Urban's method was about 6% lower than that from extd. wood except in the case of bad dry rot, when it was only about 3% lower, 3 kinds of lignin are distinguished; (1) lignin in sound, red-rotted and slightly dry-rotted wood, (2) lignin in badly dry-rotted wood and (3) lignin isolated by Urban's method. C. E. H.

Heartwood of the pine. I. Adsorption and infiltration experiments with sapwood and heartwood of pine and spruce. C. G. SCHWALBE AND A. AF EKENSTAM. *Cellulose-chemie* 10, 1-11(1929).—The expts. included measurements of the rate and amt. of adsorption of water vapor and of infiltration of water and various solns., and were designed particularly for comparison of the heartwood and sapwood of the woods examd. The pine heartwood in all cases absorbed less liquid than the other samples. In infiltration expts. with both pine and spruce the absorption of water by the green sapwood was greater than that by the green heartwood, but with increasing dryness the two values converged. Pine heartwood absorbed more NaOH than spruce heartwood, but this difference disappeared when the former had been extd. with ether. In pine heartwood the Na salt of the ether sol. acid is formed, and partly retained by the wood. In sealed tubes at 110° pine heartwood showed no difference in ability to take up liquid, but it differed particularly in absorbing Mg^{++} ions to a relatively larger extent than HSO_3^- ions from $Mg(HSO_3)_2$ soln., so that the compn. of the absorbed salt corresponded to that of a neutral sulfite. This, which is the chief cause of the failure of acid disintegration processes, is ascribed to comparatively slow diffusion of HSO_3^- ions, while the Mg^{++} ions appear to react with an acid of high mol. wt. in the wood. II. Extraction by organic solvents and alkalies. *Ibid* 10, 11-8.—The amts. extd. by ether were in the order: pine heartwood > pine sapwood > spruce heartwood > spruce sapwood. Since pine sapwood can be disintegrated by the usual processes, failure in the case of heartwood is considered to be due to a difference in the nature rather than in the amt. of resinous substances present. Examn. of the ether exts. showed that pine sapwood contained a larger proportion of fats (sol. in light petroleum) than the heartwood. The similarity of acid values indicated the presence of an acid of high mol. wt. in pine heartwood. The amt. extd. by ether from pine heartwood decreased with time of storage, the fats decreasing most rapidly. Again, the residues obtained by evapn. of the

exts. became insol. when heated or kept. These effects are explained by pptn. of col-loidal constituents. Benzene extd. smaller amts. from pine heartwood than ether, but alc. extd. larger amts., including the fraction which had become insol. in ether on storage. Pine heartwood yielded the largest amt. of ext. with 1% NaOH soln., and this was largely pptd. by HCl. The ppt. was extd. with alc., and the alk. soln. fractionally pptd. by acid. Similar results were obtained with pine heartwood and sapwood. Large amts. of very weakly dissociated acids were present, and an acid with an insol. Ca salt was isolated. Spruce, on the other hand, when similarly treated, yielded acids which were more strongly dissociated and pptd. within narrower limits of H-ion concn. Comparison of the ether exts. of the substances pptd. from the NaOH exts. of pine heartwood and sapwood showed that the former contained a quantity of acid with a sol. Ca salt which was lacking in the latter. Carbohydrates, compds. contg. N or S, or tannins could not be recognized in the ext. of pine wood by 1% NaOH. **III. Heating in sealed tubes.** *Ibid* 10, 27-34.—The effect of drying, of extn. with org. solvents and alkali, and of previous impregnation with the various exts. on the isolation of cellulose has been studied in detail with standard sealed tube heating in an attempt to elucidate the nature of the material present which inhibits the decompn. The main results are as follows: The yields of cellulose obtained by heating spruce heart- and sapwood, and Scottish pine sapwood with $\text{Ca}(\text{HSO}_3)_2$ (1% CaO, 4.05% SO_2) are, resp., 46.8, 46.0 and 48.2%, while under the same conditions the heartwood of Scottish pine is completely unattacked. Previous extn. of the latter with ether, C_6H_6 or Me_2CO before the bisulfite heating gives either no yield or only a poor quality pulp, but pre-extn. with alc. yields a good cellulose (Cf. Hägglund, *C. A.* 22, 4805). If the wood is previously air-dried or, better, dried at 105° for 40 hrs. and then ether-extd., bisulfite treatment then gives, resp., 57.8 and 64.5% yields of good cellulose. The decompn. depends on the impregnability of the wood with bisulfite, and complete drying renders the wood more permeable to the ether, allowing the more complete removal of the ether-sol. portion. When the pine heartwood is previously treated for 10 days with 0.1 N NaOH and then washed with cold water for 3 days, the bisulfite treatment yields 66.2% of cellulose (ash 1.28%). Further washing for 10 hrs. with hot water gives a 65% yield (ash 0.979%), while a final washing with 0.5% AcOH for 1 hr. and water for 2 hrs. gives a 63.4% yield (ash 0.491%). Although the substance which inhibits the bisulfite decompn. is readily removed from shavings with alkali, the use of the latter is not practicable with larger pieces used technically. Similar pretreatment with $\text{Ca}(\text{OH})_2$ soln. yields specimens from which the Ca cannot be removed by washing and which contain about the same amt. of Ca as is found after heating with $\text{Ca}(\text{HSO}_3)_2$. Subsequent heating with H_2SO_4 (2.5-3.5% SO_2) causes no decompn. From a study of the effect of impregnating the pine and spruce sapwoods with the various org. and alkali exts. of the pine heartwood on the bisulfite decompn., it is concluded that the substance which inhibits the bisulfite decompn. is acidic, forms a sol. Ca salt, is sol. in alc., C_6H_6 , Me_2CO and ether, and is insol. in light petroleum. The $\text{Ca}(\text{OH})_2$ ext. of the pine heartwood differs from the spruce exts. in that it becomes turbid on acidification, and on the basis of the above properties the isolation of this acidic substance in small quantity as a viscous brown liquid is described. B. C. A.

Carbohydrate constituents of sodium hydroxide cellulose from pine wood. E. HÄGGLUND AND F. W. KLINGSTEDT. *Cellulosechemie* 9, 77-80(1928).—NaOH cellulose obtained as a 43% yield from pine wood was found to contain mannan 3.3%, pentosan 5.3%, no galactan and only a trace of levulan. After mercerization of this material with 17.5% NaOH soln. an α -cellulose was obtained which still yielded 2.1% of mannan and 1.5% of pentosan, thus differing from a similar material obtained from sulfite pulp which contained no hemicellulose. The total mannan content is obtained by first converting the material completely to sugar and then detg. the mannose present. Lignin does not interfere with the detn. of the pentosan in the cellulose. B. C. A.

The quality of spruce wood, especially regarding its use for chemical or mechanical pulp. ELIAS MORR. *Papier-Fabr.* 26, 741-7(1928).—See *C. A.* 23, 3082. R. H. D.

Variation in the lignin content of spruce wood. P. KLASON. *Svensk Pappers-Tid* 32, 494-6, 527-30(1929).—The occurrence and the probable synthesis of lignin in wood are discussed. K. considers the H_2SO_4 method for detg. the lignin content preferable to the HCl method and describes some minor improvements he has devised in the former method. The compn. of lignin is discussed. Analyses of 222 uniform samples of wood from 12 localities in Sweden gave the following lignin contents: Norbotten 28.3% from 17 samples, Västerbotten 27.8% from 7 samples, Västernorrland 28.3% from 35 samples, Jämtland 27.9% from 7 samples, Härjedalen 28.4% from 17 samples, Hälsingland 28.1% from 9 samples, Gästrikland 28.2% from 69 samples, Dalarne 27.9%

from 12 samples, Dppland 27.8% from 14 samples, Jonkoping province 27.8% from 17 samples, Kronoberg province 28.3% from 12 samples, Kristianstad province 28.0% from 6 samples, av. of 222 samples 28.1%. From this K. concludes that climatic conditions have no effect on the lignin content of spruce wood. WILHELM SEGERBLOM

The experimental pulping plant of the "Institute für cellulosechemie" of the Darmstadt Technischen Hochschule. K. G. JONAS. *Papier-Fabr.* 27, *Fest. u. Analande-Heft*, 65-70(1929).—Descriptive. R. H. DOUGHTY

Dependence of bleachability on pulping control in the Ritter-Kellner process. HERBERT NERAD. *Papier-Fabr.* 27, 277-82(1929).—It should be possible to det. a cooking coeff. (K), or parts of incrustant dissolved by 1 part SO₂ under fixed conditions, and thence to calc. Cl₂ consumption from pulping data. From this standpoint a method has been developed which after continuous use on many cooks will show the Cl₂ consumption of the pulp within $\pm 2\%$. The amt. of SO₂ actually consumed in pulping (that added in liquor less loss in relief less loss in waste liquor), and the bleachability, were first carefully detd. in 120 cooks. This study showed that the SO₂ content at 100° controlled the degree of pulping, and the time to reach 100° controlled the total time required, to a much greater extent than any other factors. On the basis of several arbitrary assumptions a method was then developed for calcg. K from the % SO₂ at 100° (a), the % SO₂ in the blow liquor (b), the no. of times the digester was relieved (Z) (in a standard manner), the bleachability value (B) by the formula $B = 50 - Kx$ where $x = (a - b) - Z(a - b)/10$. From this the relation $K = C/\log x$ was established, C being a statistical const. derived from many cooks. From this const. and the detd. values of a and b, B could be calcd. for any cook with an accuracy of $\pm 0.2\%$ Cl₂. Finally, titration was eliminated by installation in the digester of a bimetallic electrode system connected with a recording milliammeter, the throw of the meter being related empirically to a and b in the equation given. The point when the cook should be blown to give a definite bleachability could be estd. at the time 100° was reached, and variations in quality were practically eliminated.

R. H. DOUGHTY

Testing the strength of pulp. GÖSTA HALL. *Papier-Fabr.* 27, 341-7(1929); cf. C. A. 23, 3087.—The method of grading pulps on the basis of unbeaten strength is criticized, since frequently with unbleached strong pulps a series graded on this basis may be graded in exactly the reverse order if the max. beaten strength is used. The proposed official Swedish method is described and discussed. By this method the pulps are to be tested after milling to a fineness on 40-50° Schopper in the Lampen mill. It is noted that values obtained by beating for the same time in different mills may vary considerably, because of variations in dimensions. Details of the method are given, and the tests on which it is based are discussed in detail. The method was designed to give, in a rapid test, results approximating those obtained in mill operation. It is recognized that for the complete characterization of a pulp, a beating curve must be developed.

R. H. DOUGHTY

British initial pulp strength testing method. AINSWORTH HARRISON. *Paper Trade J.* 89, No. 10, 61-3(1929).—A detailed description of the method recently adopted by the Technical Section of the Paper Makers' Assocn. of Gt. Britain and Ireland for the detn. of the unbeaten strength of pulp.

A. PAPINEAU-COUTURE

Making hand sheets of uniform thickness. F. M. WILLIAMS. *Paper Trade J.* 89, No. 12, 44(1929).—A brief discussion of the importance of the construction of the supporting plate underneath the wire screen in sheet-making machines. The best form of construction, especially where uniform thickness of sheet is required, as in pulp evaluation tests, consists in making the supporting plate with rectangular openings forming a series of cross ribs, the tops of which may be dressed to nearly a sharp edge, thereby presenting practically no flat metal surface to impede the flow of water through the screen at certain points.

A. PAPINEAU-COUTURE

Viscosity measurements on pulps. ALBERT KÜNG AND ERNST SEGER. *Papier-Fabr.* 27, 433-6(1929); cf. Öman, C. A. 23, 3083.—A procedure has been developed for measurement of the viscosity by a rapid viscose method, requiring but 10 hrs. The time reduction is obtained by eliminating the ripening periods entirely. The results are high but are closely proportional to those obtained by the usual procedure, and the accuracy is satisfactory. The method is recommended for control work. A sample of pulp cut in 1-mm. squares equiv. to 0.9 g. oven-dry is weighed out, treated with 10 cc. 17.5% NaOH, pressed to a wt. of 3.0 g., xanthogenated with 0.6 cc. CS₂, dissolved in 100 cc. 1.0 N NaOH, and tested in the Ostwald viscometer. The mercerizing requires 2 hrs., pressing to weight $1/2$ hr., xanthogenation 5 hrs., soln. 2 hrs., testing $1/2$ hr. All operations are carried out at 20°, an air bath being used. Xanthogenation is done

in a specially constructed bottle mounted on a rotating device, with gaseous CS_2 , and soln. of the xanthogenate takes place in the same bottle. The original should be consulted for details of the app. and manipulation.

R. H. DOUGHTY

Conductivity and hydrogen-ion measurements (in the pulp industry). W. N. GERR. *Paper Trade J.* 89, No. 4, 51-3(1929).—It is suggested that electrometric equipment could be satisfactorily used for H-ion concn. measurements for the control of sulfite cooking, for washing sulfite pulp and for washing soda pulp.

A. P.-C.

Freeness testing as an aid in pulp evaluation. D. S. DAVIS. *Ind. Eng. Chem., Anal. Ed.* 1, 47-9(1929); cf. *C. A.* 23, 4067.—The freeness test is recommended as the most accurate of the phys. tests, adaptable to a math. treatment, to compare a no. of pulps as to phys. properties.

F. A. SIMMONDS

A new freeness and consistency tester. D. S. DAVIS. *Paper Trade J.* 88, No. 22, 42-3(1929).—A brief description of the Williams Precision Freeness Tester and discussion of its merits. With this instrument freeness-weight plots for any sulfite stock likely to be encountered in the mill are convergent straight lines, and the coordinates of the pt. of convergence are very nearly those required by the freeness theory. The same is true of the freeness-temp. plots. Complete consistency and temp. characteristics of the instrument will be published later.

A. PAPINEAU-COUTURE

Correction curves for use with the Schopper-Riegler freeness tester. KORN. *Papier-Fabr.* 27, 123-4(1929).—When the consistency of stock in the beater is not accurately known, the amt. used for a freeness test may be detd. by rapidly drying and weighing the mat of pulp from the tester. A series of curves is given by which the Schopper freeness may be corrected for any weight of sample between 1 and 4 g., the standard being 2 g.

The beater method of evaluating pulp. H. A. ROTHCHILD, A. ELY and F. POPPE. *Paper Trade J.* 89, No. 14, 72-3(1929); *Paper Mill* 52, No. 38, 10, 28, 30(1929); *Pulp Paper Mag. Can.* 28, 567-70, 584(1929).—A brief description of the equipment, procedure of testing and interpretation of results as carried out in the mills of the Kimberly-Clark Co.

A. PAPINEAU-COUTURE

Study of the causes of variations in quality during the manufacture of mechanical pulp and paper stock. JARL ENKEL. *Papier-Fabr.* 27, 498-500(1929).—A general discussion of mill expts. on a continuous grinder, in which pulp quality was judged on the basis of blue-glass test, freeness and bursting strength. The effect of decreased pressure (2.0-1.0 kg./sq. cm.) is to increase quality, the effect being more marked with a relatively hard, fine-grained stone. Increased temp. leads to increased freeness and lower power consumption, with little if any effect on strength. Natural and artificial stones if properly sharpened are of equal value. Artificial stones properly handled need little sharpening; for natural stones the quality depends less on the coarseness of the burr than on the sharpening pressure. Wood with 15 and 45% moisture content gave pulp of equal strength, and with the same power consumption; the pulp from the dry wood was much finer and gave a lower freeness value. Considered solely from the strength standpoint, a considerable infection of "red rot" in the wood is of no consequence. Rejects from the sorters are better refined by kollergang or rodmill than by the usual refiner, which gives a very weak product. Since the quality of mech. pulp is subject to unavoidable variations, it is suggested that a brief controlled processing in some continuous system such as a rodmill would be a valuable addn. to newsprint manuf.

R. H. DOUGHTY

Pulp evaluation and its adaptability to paper making. O. P. GEPHART. *Paper Trade J.* 89, No. 1, 53-5(1929).—A discussion of the tests which should be carried out on purchased pulp to det. its suitability for the purposes to which it is to be put, and of the interpretation of the results of these tests, particularly as regards strength developed on beating under the conditions existing in the purchasing mill.

C. E. CURRAN

The changes of moist sulfite pulp in storage. ERNST HOCHBERGER. *Papier-Fabr.* 27, 282-4(1929).—The "isoelectric point" of sulfite pulps changes toward the acid side during storage, and apparently toward the same const. value for all pulps.

R. H. DOUGHTY

The reddening of unbleached sulfite pulps. B. RASSOW and G. BRANDAU. *Papier-Fabr.* 27, 181-7, 202-10, 217-25(1929).—The red coloration is due to the formation of an intermediate oxidation product from a substance which is present in the pulp in a colorless form, and which, on oxidation, becomes at first red and then white. The ten-

dency of a pulp to turn red depends on degree of pulping, on compn. of the cooking liquor, on washing and duration of storage. It can be removed by oxidation or by treatment with dil. mineral acids, hot water or pyridine. The extent of reddening is independent of moisture, Fe and rosin content of the pulp. The lignin content, and fluorescence of the pulp in ultra-violet light, are measures of the tendency to redden, but the red color is proved not to be caused by the lignin nor by the fluorescing substance, which latter is probably lignosulfonic acid (I). The authors believe that the reddening is caused by an absorption complex (II) of cellulose or other carbohydrates with a sort of lignosulfonic acid which is produced by chem. transformation of the lignin during sulfonation. The behavior of II during pulping is the same as that ascribed by Hägglund to I. A detailed discussion of the various theories put forward by others on this subject is included.

R. H. DOUGHTY

Determination of the Sieber chlorine-consumption number of sulfite pulps. W. HUMM. *Papier-Fabr.* 27, 387-9(1929).—One of the difficulties of detg. the Sieber no. is to prep. a soln. contg. the equiv. of 10 cc. 0.1 N alkali in a vol. contg. 0.3 g. available Cl_2 . A soln. contg. exactly 11 g. Cl_2 per l., satd. with $\text{Ca}(\text{OH})_2$ and filtered, will contain the desired quantities of Cl_2 and $\text{Ca}(\text{OH})_2$ in a vol. of 27.3 cc., which may readily be measured with a special pipet or buret. A simple slide-rule is illustrated, which shows the Sieber no. for samples of 4 to 6 g. and back titrations of 0 to 16 cc. R. H. D.

Importance of hydrogen-ion concentration in sulfite pulping. E. HÄGGLUND. *Papier-Fabr.* 27, 165(1929).—Pulp produced by use of a NaHSO_3 cooking liquor, and known to contain sulfonated lignin, was treated under standard conditions with hot H_3PO_4 - K_3PO_4 buffers of varying p_{H} values and the change in lignin content studied. The rate of soln. of the sulfonated lignin depends mainly upon the p_{H} , the amt. dissolved being greater, the greater the acidity of the buffer. These results confirm the theory that sulfite pulping proceeds in 2 stages, first sulfonation followed by soln. of the solid lignosulfonic acid. It is in the latter stage that the speed is controlled by H-ion concn.

R. H. DOUGHTY

Chemical control in the sulfite pulping process. B. RASSOW AND H. KRAFT. *Papier-Fabr.* 27, 489-95, 508-14, 524-8(1929).—Three methods of control during pulping are possible: by testing the pulp, by following the formation of lignin derivs. or by following the sulfonation process. The 2 last-named have been studied by the authors, especially the second, with satisfactory results. Samples of liquor taken at intervals during 9 cooks on wood from 3 sources were used. The α -lignosulfonic acid (A) was pptd. with β -naphthylamine-HCl (I) (cf. Klason, *C. A.* 14, 3229) and with benzidine-di-HCl (II) and analyzed, the methods and results being reported in detail. The use of II was more satisfactory in several ways than that of I. By this method 50 cc. of liquor was dild. to 100 cc., a 30-cc. portion pptd. with 20 cc. of a standard soln. of II, dild. to 100 cc. and filtered through a dry filter. A 10-cc. portion of the filtrate was treated with 30 cc. of a 5% $\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$ soln., the pptd. benzidine sulfate filtered and washed with cold H_2O , under suction, dissolved in boiling H_2O , and the liberated acid titrated with NaOH and phenolphthalein. From this titration the II equiv. to the A present was calcd. The soln. of II was prepd. by rubbing 40 g. benzidine with 40 cc. H_2O , transferring to a flask with 800 cc. H_2O , and making up to 1 l. after addn. of 50 cc. HCl (1.19 sp. gr.), filtering if necessary. This method was used for most of the exptl. work. On the basis of the analytical results it appeared that the ppt. obtained consisted of at least 2 compds., of which one is salted out by II, while the other is a compd. of A with II. The A going into soln. during the cook takes up more SO_2 after soln., increasing the consumption of II. Production of vanillin from the ppt. by cold oxidation with HNO_2 is in agreement with the Klason's coniferylaldehyde theory of lignin. When A as detd. by II is plotted *vs.* pulping time, it increases at first very slowly, then quite rapidly to a sharp max. value, which is maintained thereafter. In conformation to Hägglund (cf. *C. A.* 20, 3807) the first period is considered as sulfonation, the second as hydrolysis, while the third or const. period is termed the "quality period," since it is here that the quality of the pulp is detd. The 2nd period, corresponding with the true pulping reaction, starts at varying intervals after the start of the cook, depending on the source of the wood. (It should also be noted that the temp. control was different in the different cooks.) The fiber is not entirely delignified at the end of the 2nd period. That the reaction thereafter is of a different character is indicated by the constancy of A. The longer the 3rd period, the softer the pulp. In the cooks here studied this period was 1 hr. for a strong pulp and 4 hrs. for an easy-bleaching pulp. On this basis, detn. of the start of the 3rd period, by regular analysis of the liquor using the above method, which can be performed in 15 min. in the lab., is suggested as a new control method for sulfite pulping.

R. H. DOUGHTY

Sulfite liquor preparation from pyrites. HUGO LAUBER. *Papier-Fabr.* 27, 65-9 (1929).—Fineness and evenness of crushing, type of oven and presence of Cu in ore have a considerable influence on the S losses. Pyrites should be graded on the basis of S in the finished liquor, not of S in the ore. Roasting, gas purifying and absorbing equipment is described.

R. H. DOUGHTY

Production of absolute alcohol from sulfite spirit. H. KIRMREUTHER. *Papier-Fabr.* 27, *Fest- u. Auslands-Heft*, 102-6 (1929).—Difficulties in the use of sulfite spirit as a motor fuel are attributed to its water content of 4 to 5%. The technical spirit can be converted to abs. alc. by distn. with lime or with benzene. The latter process has the advantage that it may be made continuous. App. for the purpose is described.

The Thorne pressure process of sulfite cooking. C. B. THORNE. *Paper Trade J.* 89, No. 7, 61-2 (1929).—A description of U. S. pat. 1,691,682 (*C. A.* 23, 514). A. P.-C.

The Wolf sulfur dioxide recovery system. R. B. WOLF. *Paper Trade J.* 89, No. 5, 49-50 (1929).—A description of U. S. pat. 1,699,556 (see *C. A.* 23, 1270).

A. PAPINEAU-COUTURE

Studies on the waste (sulfite) liquor of pulp manufacture. A. HEIDUSCHKA AND E. MUNDS. *Z. angew. Chem.* 42, 11-5 (1929).—The noxious effects of waste liquor are due to the growth of *Leptomitius lacteus* and *Sphaerotilus natans*, which develop at the expense of the sugars and other org. compds. present. Typical analyses of waste liquor show that at most only 1% of the cellulose is converted to sugars during the cooking process. The liquor also contains 0.10-0.80% SO_2 (depending on the duration of the cook and type of pulp made), traces of SO_3 , 0.16-0.81% AcOH and 0.009-0.018% HCOOH . A study of the effects of various concns. of these and other compds. on the *Leptomitius lacteus* showed that SO_2 up to 0.8% had no effect while higher concns. stopped the growth or destroyed the fungus. With AcOH , HCOOH , NaOH , KOH and NH_3 , there was no effect on the fungus up to concns. of 0.04, 0.03, 0.001, 0.002 and 0.01%, resp.; the limits of growth were 0.3, 0.1, 0.05, 0.07 and 0.06%, resp.; and the limits of existence were 1.4, 0.9, 0.2, 0.3 and 0.20-0.25%, resp. With no dissolved O_2 present, growth was very slow. At temps. above 32° the fungus was killed. In sulfite waste liquor (sp. gr. 1.060) and alc. sulfite waste liquor (sp. gr. 1.13) growth of the organism began at concns. of 0.0001 and 0.001%, resp.; optimum growth occurred at 0.1 and 0.9-1.2%, resp.; and destruction at 5.8 and 10.5%, resp. By walling up the waste liquor to increase its concn. the fungi and their accompanying evils may be partially eliminated.

Apparatus for concentration of waste sulfite liquors. D. R. W. MÜLLER. *Svensk Pappers-Tid.* 32, 530-2 (1928).—The app. is described.

WILHELM SÖGERBLOM

Longview mill evolves new technique for sulfate pulp process. R. S. WERTHEIMER. *Chem. Met. Eng.* 35, 596-600 (1928).—Description of the Longview Fibre Co. mill, Longview, Washington, with particular reference to the new type recovery system claimed to eliminate odors through burning of org. S compds. resulting from the process.

C. E. CURRAN

The sulfate process and kraft paper. GEORGE VOGHT. *Paper Mill* 52, No. 23, 26, 28, 58, 81; *Paper Trade J.* 88, No. 24, 77-8 (1929); *Paper Ind.* 11, 467, 469 (1929).—After a brief outline of the early development of the process, the latter is described.

A. PAPINEAU-COUTURE

Sulfur reactions in sulfate recovery systems. MARGOT DORENFELDT-HOLTAN AND E. HOLTAN. *Paper Trade J.* 89, No. 10, 59-60; *Papir-Journalen* 17, 70-3 (1929).—After a discussion of the reactions of S and S compds. in the recovery of sulfate black liquor, results are given of an investigation into the S balance of the recovery system, which are summarized as follows: of the S going to the recovery, 31.5% is lost in the

smelter, 24.75% is lost in the rotary and 17.25% is absorbed in the disks, making a net loss of 39%; 9.45% of the S sent to the recovery is present in the volatilized salts; 34% of the S added to the smelter is lost, 37% of the S added to the rotary is lost, and the disk evaporator absorbs 35% of the S added to it; the smelt contains 15.5% more S than the black liquor; the S from salt cake amounts to 50% of the S added to the system; the total S loss is 77% of the S added as salt cake. A. PAPINEAU-COUTURE

Modern recovery in sulfate and soda mills. C. L. WAGNER. *Paper Trade J.* 89, No. 14, 82-3(1929); *Pulp Paper Mag. Can.* 28, 598-9(1929); *Paper Ind.* 11, 1210-1(1929).—A brief outline of the latest improvements in the Wagner recovery furnace. It is claimed that total furnace recoveries of 97-8% are obtained, and that if use can be made of water at 160°F., the thermal efficiency of the unit is up to, or higher than, that of modern boiler units. A. PAPINEAU-COUTURE

The electro-natron process for the regeneration of sulfate black liquor. F. WALLENBERGER. *Papier-Fabr.* 27, 81-3(1929).—An exptl. plant is under construction to test this patented process, which is basically as follows: The black liquor is treated under suitable conditions with HCl, whereby the org. matter is pptd. and all the S driven off as H₂S, which is collected. The filtered liquor contg. NaCl is electrolyzed, giving H and Cl gases and NaOH soln. The 2 former are burned to give HCl, which is returned to the process, while the H₂S previously liberated is absorbed in the caustic soln. to form fresh cooking liquor. Losses, which should be small, are made up with NaCl and Na₂S. Special advantages are avoidance of odor and of lime sludge production. Sulfates in the liquor might prevent successful electrolysis. R. H. DOUGHTY

Volatile substances found in soda and sulfate cellulose plants, their use and means for rendering them harmless. E. ÖMAN. *Svensk Pappers-Tid.* 32, 313-7, 351-5(1929).—A résumé of the work of Bergström and Fagerlind on the useful volatile substances and of Klason, Brahmer and others on the useless volatile substances resulting in sulfate cellulose plants. A. PAPINEAU-COUTURE

Safety precautions for preventing the explosion of digesters. ANON. *Svensk Pappers-Tid.* 32, 561-3(1929).—A recent explosion of a digester in a sulfite plant in Saxony is described. Precautions have been drawn up for the prevention of similar explosions. Detailed specifications are given for the inspection of digesters already in use as well as for those in process of construction. WILHELM SEGERBLÖM

Wood pulp of today. N. L. NORSSE. *Paper Ind.* 11, 471, 473(1929).—A brief outline of the development of high-purity wood pulps (contg. 92% and over of α -cellulose) and discussion of the reasons why they so readily find application in high-grade, coarse and fine papers. A. PAPINEAU-COUTURE

The evaluation of wood pulp. J. W. BERRIMAN. *Proc. Tech. Sec. Paper Makers' Assoc.* 9, 114-9(1929); cf. C. A. 22, 3294. C. E. CURRAN

Bibliography of wood pulp strength testing. W. F. MOORE. *Paper Trade J.* 89, No. 12, 62-72(1929).—A review in the form of abstracts of 63 articles published on the subject since 1915 (one reference in 1905). A. PAPINEAU-COUTURE

Observations on mechanical wood pulp. PER KLEM. *Papier-Fabr.* 27, 467-9(1929).—Mech. pulp (I) has been sepd. by screening into fibers (II) and fines (III) (Mehlstoß), and the characteristics of mixts. of these with each other and with unbeaten sulfite (IV) have been studied. Breaking length increased from 500 m. at 100% II to 3000 m. at 100% III, slowness from 12° to 80° Schopper. A max. breaking length was found in mixts. of 80% I and 20% IV, and of 60% III and 40% IV. Addn. of II to IV caused a steady decrease in strength. Hence, the fines are the more important part of mech. pulp from a strength standpoint. The "Hurum Mehlstoß Apparat" (or flour tester) for detg. the % of fines is recommended as a valuable testing instrument, both for mech. and chem. pulps, particularly in the relations of fiber characteristics to strength and slowness. R. H. DOUGHTY

Wood pulp and its properties. PER KLEM. *World's Paper Trade Rev.* 91, 2190-2200(1929); *Pulp Paper Mag. Can.* 28, 173-5(1929); cf. preceding abstr. A. PAPINEAU-COUTURE

The fiber length of wood pulps. G. K. BERGMAN and ALBERT BACKMAN. *Papier-Fabr.* 27, 449-56(1929).—The fibers of samples of unbeaten pulp were measured and counted on enlarged projections of carefully prepd. slides. The method of prepg. the

slides and of analyzing the data is given in detail; 1500 to 3000 fibers were used for each sample. The *av. fiber length* (I) (total length divided by no. of fibers) is disproportionately influenced by extremely short (0 to 0.5 mm.) fibers; the *equiv. mean length* (II) obtained from a distribution diagram is preferred for characterization of the pulp. Detailed measurements and diagrams are given for 13 samples. The ranges of values obtained for I and II, resp., are, in mm., for sulfite pulp, 0.755 to 0.896; 1.931 to 2.228; for sulfate pulp, 0.946 to 1.152; 2.043 to 2.380. Conclusions: Sulfate pulps contain less fibers of < 0.5 mm. than do sulfite pulps; the breaking of fibers in chipping is probably the main source of short pieces; the differences noted in fiber length between different pulps are unimportant from a paper-making standpoint, and the source of differences in pulp character usually charged to low fiber length should be sought for elsewhere.

R. H. DOUGHTY

Identification and evaluation of unbleached chemical wood pulps. GÖSTA A. HALL. *World's Paper Trade Rev.* 91, 1340-54, 1396, 1398, 1442, 1444, 1484-92, 1530-6, 1586, 1630-8, 1676-88, 1738-50, 1818-34, 1906-16; *Paper Maker & Brit. Paper Trade J.* 77, 479-87, 591-5; 78, 17-23; *Svensk Pappers-Tid.* 32, 356-60, 389-96, 423-8, 459-63 (1929); cf. *C. A.* 22, 3298; 23, 3078.—The relation between the treatment and properties of unbleached chem. wood pulps, particularly unbleached sulfite and sulfate pulps, is discussed in the light of H.'s investigations. With sulfite pulps the correspondence between the strength properties of the unbeaten pulps and the properties developed through beating is rather good, though not entirely reliable; but with unbleached sulfate pulps the results may be entirely misleading. This is attributed to the fact that the strength properties indicated by tests on unbeaten pulp depend largely on the felting capacity of the pulp, the fibers simply pulling apart without rupture in the tensile and bursting tests; while under similar conditions the fibers of any machine-made coarse paper break to a large extent, so that it is impossible to predict the character of the paper from tests on the unbeaten pulp. Tearing tests on the unbeaten and beaten pulps correspond remarkably well; so this test might be applicable to unbeaten pulps directly. The results obtained by beating in the Abbé pebble mill and in the Lampén ball mill are compared and discussed (cf. *C. A.* 23, 3087). A modification of the Sandberg and Bergman sheet-making machine has been devised. When the test sheets are made under conditions comparing with those of the paper machine, e. g., a sheet is assumed to be taken about the 1st wet press, the lab. paper is stronger (tensile, bursting and folding tests) because of the more uniform distribution of the fibers; if the pressure is lowered to about 200 lb. per sq. in., the character of the lab. paper compares rather well with that of the machine-made paper, showing that the influence of the decrease in pressure is then just about compensated by the better formation; at lower pressures the paper becomes too porous. Lab.-made paper pressed at about 200 lb. does not show higher tearing strength than machine-made paper, as could be expected, on account of the lower pressure, which fact indicates that tearing strength should be inversely proportional to the formation. The fine fiber fragments contained in the white water increase the tensile and bursting strengths and lower the tearing strength and porosity. Lampén mill beating gives a decidedly stronger (tensile and bursting strengths) and stiffer paper than paper mill beating to the same fineness. The pressure would have to be reduced to about 50 lb. in order to get a paper of the Lampén mill-beaten pulp with approx. the same strength properties as those of the machine-made paper; but the lab. paper thus prep'd. is considerably more porous than the machine-made paper. The factors of paramount importance to the character of chem. wood pulp are the character of the wood used, the degree of cooking and the treatment given the wood in the pulping process, each of which is briefly discussed. The results of a series of beating tests carried out on hard kraft, soft kraft, "strong" kraft, bleachable sulfate, direct-cooked sulfite and indirect-cooked sulfite led to the following conclusions, which indicate general trends only: (1) Sulfite pulps are generally more easily hydrated than sulfate pulps of corresponding bleachability, which is due to the lower α -cellulose and higher polysaccharide (β -cellulose) contents of the former. (2) A direct relation between lignin content on the one hand and folding, bursting and tensile strengths on the other hand must exist; the strength as indicated by these 3 properties increases with the lignin content. (3) The tearing strength shows a max. at a lignin content of about 5% in both the sulfate and sulfite series. (4) The sulfite pulps cooked with indirect steam show, relatively to the sulfate pulps of corresponding bleachability, higher bursting and tensile strengths but lower folding endurance and tearing strength. (5) The difference in strength between the direct-cooked and indirect-cooked sulfite pulps is probably due partly to the difference in β -cellulose content and partly to the fact that direct steaming is more harmful to the strength of the fiber

than indirect steaming. (6) The porosity is a more significant indication of the beating condition of the fiber than the "freeness" or "degree of beating"; from a practical viewpoint, however, the porosity cannot replace the freeness tests. (7) At the same degree of beating and the same lignin content, the sulfate pulps give more porous paper than corresponding papers made from sulfite pulps. (8) The harder the pulp, the more porous is the paper produced from it. (9) The less a sulfate pulp is cooked, the darker it is. (10) Sulfite pulps generally give a less absorbent paper than sulfate pulps; the absorbency stands in direct proportion to the degree of cooking for both kinds of paper. (11) There is a considerable difference in "self-sizing" through beating between sulfite and sulfate papers, which is attributed to the rosin and β -cellulose, the latter, upon beating, gradually disintegrating and filling the interstices between the fibers, making the paper less absorbent. The discussion by those present at the presentation of the paper is given.

A. PAPINEAU-COUTURE

Pulping of wood with magnesium bisulfite solutions. BRUNO POSSANNER VON EHRENTHAL. *Papier-Fabr.* 27, 537-43(1929).—Five cooks were made in a 50-l. digester, using liquors contg. 0, 25, 50, 75 and 100% Mg, resp., and the remainder Ca bisulfite, with about 5.1% total and 1.2% combined SO_2 . Chips and liquor were placed in the digester overnight for thorough penetration. At the start of the cook the temp. was brought to 105° in about 20 min., shut in for 3 hrs., then brought to 128°, which was maintained until titration of a liquor sample showed but 0.1-0.2% SO_2 , when the cook was considered completed. The more important results are given for the different cooks in increasing order of Mg content as above: total time, 10.5, 9, 8.2, 7.5, 8.5 hrs.; yield, 42.2, 40.8, 40.6, 41.3, 45.5%; Cu no., 3.7, 3.1, 2.8, 2.6, 2.5; Sieber Cl₂ no., 42, 40, 38, 25, 23; α -cellulose, 67, 79, 73, 76, 76%; lignin, 4.4, 4.1, 3.7, 3.2, 2.8%. These results are strongly favorable to the use of Mg base for sulfite pulping. Considerable space is given to discussion of the practicability of using waste potash-works waters, contg. about 50% MgCl_2 , as the source of Mg. The liquor used in the present case, prepd. by pptg. MgCl_2 with Ca(OH)_2 and using the Mg(OH)_2 sludge, contained considerable CaCl_2 . One advantage of using pptd. Mg(OH)_2 is its rapid absorption of SO_2 , due to large and fresh surface.

R. H. DOUGHTY

Pulping of red beech and white birch by the sulfite process. OTTO WURZ. *Papier-Fabr.* 27, 495-8(1929).—Heuser (cf. Hügglund, C. A. 23, 4067) has claimed that deciduous woods cannot be pulped successfully by the sulfite process, at least without using a very high CaO liquor. Sembritzski reports favorable results, while Klein (C. A. 23, 5585) states that "beech and birch have been pulped by secret sulfite processes for some time" in Germany. W. suspects that difficulties in pulping beech wood may be due to the high density requiring a longer penetration period than for spruce. Chips of both woods were first pulped by suspending in a large digester during a regular cook on spruce, and later in an exptl. digester of 7 l. capacity, in which the ratio of wood to liquor was 1 to 7. Yields of 49% of readily bleachable pulp with an α -cellulose content of 87-88% were finally obtained from both woods. The beech was pulped with an acid contg. 5.05% total, 1.3% combined SO_2 , taking the temp. to 110° in 3 hrs. and to 140° in 6 hrs. more. The acid used on the birch contained 4.6% total, 1.3% combined SO_2 and a max. temp. of 132° was reached in 4 hrs. from 110°. Careful control near the end of the cook was necessary to prevent burning. The waste liquor was much darker than that from spruce, and a good washing of the pulp was required for even and complete bleaching. The possibilities for use of this type of pulp, which appear promising, should be studied in large-scale operations.

The shive count as a factor in mill control. A. B. LARCHER. *Paper Mill* 52, No. 23, 42; *Paper Trade J.* 88, No. 24, 93(1929).—A brief discussion of the application of shive count for controlling the quality and uniformity of soda pulp.

A. P.-C.

Parenchyma in straw pulp. KORN. *Papier-Fabr.* 27, 311-4; *Wochbl. Papier-*

fabr. 60, 614-7(1929).—By *parenchyma* is meant bundles of cells in their natural state; single cells are not considered. It was found by microscopic testing that the majority of flecks in very badly flecked papers were these parenchyma bundles. No direct relation appeared between method or degree of pulping, and freedom from these flecks; accurate knowledge of the whole process of prepreg. the pulp is required for detg. this. Since parenchyma occurs mainly in the nodes, careful removal of these before (or) after pulping is necessary. Four photomicrographs of typical flecks are given.

R. H. DOUGHTY

Pulping straw with nitric acid. H. SUIDA, H. SADLER AND F. NOSS. *Papier-Fabr.* 27, *Fest- u. Auslands-Heft*, 71-9(1929); cf. *C. A.* 22, 4807.—In this study 50 tests were made, using 30 g. straw, 230 cc. HNO_3 of 1.4 to 10.8% by wt. concn., reaction times of 35 to 80 min., and temps. of 68-99° (temp. of bath; av. temp. of reacting material 10° lower). The material was pulped in covered beakers in a H_2O bath, the acid lost by evapn. being detd. The pulp was washed with hot H_2O , treated 30 min. with 300 cc. hot 1.7% NaOH soln., washed with HOAc and H_2O , and dried to det. the yield. In a second series of 30 tests the concn. and temp. of the NaOH soln. were varied, and in a third series of 25 tests the pulping time was increased to 180 min. Detailed data covering the yields are presented, and it is stated that all pulps lower than 50% yield appeared, from bleachability tests, technically usable. The yields varied from 40% with a useful HNO_3 consumption of 50% (basis pulp) to 45-50% with 15% of HNO_3 , and 60% with 5% of HNO_3 . The yields from the various tests varied in the usual manner with acid consumption, with time, temp. and concn. of the acid, and with temp. and concn. of the alkali wash.

Is it possible to determine the mechanical pulp content of paper accurately to fractions of a per cent? KORN. *Wochbl. Papierfabr.* 60, 236-7; *Papier Ztg.* 30, 472; *Papier-Fabr.* 27, 142(1929); cf. C. A. 22, 4806.—The method in question (cf. Halse, C. A. 19, 1946) bases an est. of the amt. of mech. pulp on the lignin detn., using empirical values for the lignin content of av. mech. and chem. pulps. The probable inaccuracy of such a test is obvious. Some remarks on the accurate determination of mechanical pulp in paper. FRANZ FRANK and FRANZ MÜLLER. *Wochbl. Papierfabr.* 60, 484-5(1929).—The Halse method has an error of the order of $\pm 10\%$. R. H. DOUGHTY

Chemical determination of groundwood in paper. E. H. RIESENFELD AND T. HAMBURGER. *Cellulosechemie* 10, 125-6(1929).—The Halse chem. method of detg. the groundwood or mech. pulp content of paper (cf. C. A. 19, 1946; 22, 4806) can give accurate results only when the lignin content of the component pulps is accurately known. Analyses of 4 paper samples of known groundwood content gave less satisfactory results than would be obtained by the microscopic method. OSCAR T. QUIMBY

Tendencies and aims of fibrous material analysis. C. G. SCHWALBE. *Papier-Fabr.* 27, 293-5(1929).—An address, outlining the methods and aims of research on pulp and paper, and especially the work of the Faser-Analysen Commission. R. H. DOUGHTY

Purified wood fibers as a paper-making material. ROYAL H. RASCH. *Bur. Standards J. Research* 3, 469-506(1929); cf. C. A. 23, 3096. F. A. SIMMONDS

Suitability of eucalyptus for paper pulp. BENNETT PREBLE. *Paper Trade J.* 88, No. 26, 53-60(1929).—After reviewing the work which has been done to date on the pulping of eucalyptus, an account is given of an investigation into the pulping characteristics of the principal species of eucalyptus grown in California (*E. globulus* (blue gum), *E. torynocalyx* (sugar gum), and *E. tereticornis* (gray gum)). The sulfate process was used at first, but as its use had to be discontinued, the so-called "hypo" process (using a soln. of NaOH and of $\text{Na}_2\text{S}_2\text{O}_4$) was used, which, though it probably could never be used commercially, gives a pulp very similar to sulfate pulp. Blue gum was very easily reduced, giving a high yield of light-colored pulp. Although the fibers are shorter than those of red cedar (taken as typical of the conifers), the felting power (ratio of length to diam. of fibers) is high. The strength developed by a remarkably short heating period is higher than that of the best sulfite pulp. Slightly less favorable results were obtained with gray gum, the pulp being much darker than that of blue gum and somewhat darker than that of red cedar, and not quite as strong as that from blue gum. Sugar gum did not give promising results, the wood being hard to reduce and the color of the pulp poor. Further efforts on pulping of this species by alk. processes are not considered worth while, and it is suggested that the possibility of pulping it by the sulfite process be investigated. A chronological bibliography of work on the use of eucalyptus for paper making is given. A. PAPINEAU-COUTURE

New processes for the production of paper pulp from wood. ARTHUR ST. KLEIN. *Papier-Fabr.* 27, 325-30(1929).—A literature and patent review of suggested new processes and modifications to old processes of pulping. In spite of the great no. of such suggestions, an entirely new. practical and inexpensive pulping process has not yet

been proposed, and the fundamental factors governing the paper-making qualities of a pulp have yet to be explained.

R. H. DOUGHTY

Paper-making value of papyrus from Northern Rhodesia. ANON. *World's Paper Trade Rev.* 92, 1-2(1929); *Paper Maker & Brit. Paper Trade J.* 78, 169-70(1929).—The compn. of the material was: H₂O 8.1, ash 4.1, cellulose 37.7% (on dry basis 41.0), fiber length 0.8-4.0 mm (av. 1.72), fiber diam. 0.005-0.0254 mm. (av. 0.0126). Cooked with 16% NaOH (on the wt. of the stems) at a concn. of 3% for 3 hrs. at 140°, it yielded 35% of well-reduced unbleached pulp which furnished a thin translucent type of hard, rather rattly, pale brown paper of excellent strength, contg. a small quantity of imperfectly digested material. The pulp bleached fairly readily (yield 27% on the original material) to a pale cream color, and then furnished paper similar in strength and character to that from the unbleached pulp, except that it contained practically no imperfectly digested material. After removing about 30% of pithy material by mech. means, the compn. was: H₂O 6.7, ash 4.2, cellulose 40.0% (42.9 on dry basis). Under the same cooking conditions as above it yielded 40% unbleached and 34% bleached pulp, which furnished a rather hard, rattly, opaque paper, somewhat superior in quality to that from the original stems. Sepg. 28.5% pith mechanically, soaking in H₂O, boiling in H₂O, boiling 30 min. with 1% NaOH, washing free from NaOH, beating lightly and finally washing, sieving and drying yielded 17.9% of fibers with only a slight quantity of pith adhering. The quantity obtained was too small to permit of making sheets.

A. PAPINEAU-COUTURE

Paper-making value of reeds from Northern Rhodesia. ANON. *World's Paper Trade Rev.* 92, 185-6(1929). Reeds (*Phragmites vulgaris*) had the following compn. H₂O 7.5, ash 1.9, cellulose 50.0 (on dry basis 54.1%), fiber length 3.0-6.8 mm. (av. 1.7), fiber diam. 0.0102-0.0580 mm. (av. 0.0193). Cooking with 16% NaOH (on the wt. of the stems) at a concn. of 4% for 4 hrs. at 140° gave 49% of generally well-reduced pulp, which furnished a rather soft, opaque, fairly bulky, pale yellowish brown paper of fairly good strength, but contg. numerous specks of imperfectly digested material from the nodes. The pulp did not bleach readily, but after treatment with a strong bleaching soln. it yielded 39% (on the original material) of cream-colored pulp, which furnished a paper of similar character and strength to that from the unbleached pulp. Cooking as above, but at 150°, gave 47% of unbleached and 39% of bleached pulp of satisfactory whiteness, which gave a paper free from unbleached specks. The pulp is rather similar to that furnished by esparto, but requires about twice as much bleach. In practice, the nodes could readily be removed in screening the pulp. A. P. C.

Paper pulp from New Zealand-grown woods. A. R. ENTRICAN. *New Zealand J. Sci. Tech.* 11, 65-80.—Insignis pine and kahikatea groundwood pulps were yellowish but strong, the sulfite pulp had a good color, and the sulfate pulp was good. Rimu and kauri were generally suitable. Austrian and Corsican pines and European larch produced fairly strong wrapping papers. Of the hardwoods, tawa was best for a variety of pulps; the unbleached sulfite was suitable for a new type of newsprint. The remaining hardwoods were limited to bleached soda pulps for book and similar paper.

F. A. SIMMONDS

Megass. Its value as a material for the manufacture of paper and of artificial silk. ANON. *Trop. Agr.* (Trinidad) 6, 200-2(1929).—Megass, as received, contained 10.8% H₂O, 1.2% ash and 51.2% cellulose. A course of treatment was devised which converts this material into a form suitable as a source of cellulose for the paper and artificial silk industries, but it is not believed to be cheap enough for present exploitation.

A. L. MEHRING

The effect of atmospheric humidity on paper. L. E. WALTER. *Papier-Fabr.* 27, 369-71(1929).—The rate of change of weight and length with varying humidity of strips of 13 papers from 3 mills was detd. at 10° and 740-mm. barometric pressure. The samples were cut from the center of the web and stored 6-8 weeks in a cold dry room before testing. It was found that: (1) Moisture was absorbed or given up more rapidly from strips cut in (I) rather than across (II) the machine direction; (2) at low humidities the max. moisture content of the paper increased more slowly, in the middle range at the same rate, and at high humidities faster than the moisture content of the air; (3) the elongation in II (too small to be detd. in I) was proportional to the water taken up, and hence bore the same relation to relative humidity; (4) the absorption and giving up of H₂O at ordinary temp. is entirely reversible; (5) the elongation is partially irreversible.

R. H. DOUGHTY

Hydration, paper formation and strength. GUNNAR PORRVIK. *Pulp Paper Mag. Can.* 28, 133-6, 149-50; *Svensk Pappers-Tid.* 32, 191-6(1929).—The degree of freeness of pulp is detd. by the water which the pulp holds, which is of 3 kinds: outer capillary

water (remaining in the interstices between the fibers), inner capillary water (in the lumen of the fibers) and water in the fiber walls. The holding together of the fibers in paper is not in any essential degree a felting process, but a phenomenon of colloidal chem. "sizing," or binding of the fibers to one another. The significance of beating is that, through mech. working, the degree of swelling of the fiber walls is increased, whereby the fibrous tissues are rendered more capable of "sizing" and more plastic. The fibrous walls consist of several sheaths; when the outer sheath (the "sizing" sheath) swells, the power of the "sizing" particles is increased, and thereby the strength. When the fundamental substance swells, the fibers are split into fibrils, and a paper of more delicate texture is obtained. Beating is not an uninterrupted process, but falls into 3 stages, during which essentially different phenomena occur. In the 1st stage, extending to 30° Schopper-Riegler, the inner capillaries are filled and a portion of the sub-microscopic "sizing" substance in the fiber walls is filled with water with simultaneous expulsion of air. In addn., a colloidal swelling of the fiber walls takes place. This results in an increase in the vol. of the fibers in their moist state and produces a great increase in their plasticity and "sizing" power. In consequence, these fibers are much more capable of union and sticking together after pressing. In this stage the outer capillaries contract, contributing to the making of a thicker paper with lower absorbency. The most important effect is the fact that the surfaces of the fibers that touch one another increase. In the 2nd stage, extending from 30° to about 80° Schopper-Riegler, the swelling caused by kneading of the fibers increases, which especially contributes to the plasticity of the fibers and the "sizing" power of the outer layer. In the 3rd stage, above 80° Schopper-Riegler, there is an active splitting into fibrils, whereby the inner capillaries cease to exist. Between the fibers a new capillary surface is formed, very short, and consequently resistant to pressure.

A. P.-C.

Effect of drying on the strength of paper. ERNST RIETH. *Papier-Fabr* 27, 385-7 (1929).—Sample sheets of a beaten pulp dried freely in the air gave a tensile test of 5800 m. breaking length and 2400 double folds, while others dried at 103° on a cylinder under tension tested 8300 m. and 1100 folds. The shrinkage on drying and H₂O content after seasoning at 65% relative humidity were lower in the latter case. Other methods gave intermediate values. Drying on the cylinder to various moisture contents showed that the more the paper was dried, the less its equil. moisture content, and that drying to below 8% moisture was necessary to give max. tensile strength. It is pointed out that the degree of hydration is an important factor in strength testing, that this may vary even with the same pulp beaten to the same slowness in different ways, and that control of drying procedure offers a way of controlling the effect of this variable in testing.

R. H. DOUGHTY

p_H control in the paper mill. A. B. HANSEN. *Paper Mill* 52, No. 40, 3, 6 (1929) — A definite ratio between size and alum should not be followed for different papers. The best p_H value for sizing may not be the same for different mills. It should be detd. for each mill. It will probably lie between 4.0 and 6.5. Decreasing the p_H value or increasing the H-ion concn. increases the rate of deterioration of paper. In general, beating takes place more rapidly at higher p_H values than at lower ones. Decreasing p_H values increase the corrosiveness of stock and white water on paper-mill equipment. A "standard" p_H value for each grade of paper should be set at each mill and followed closely.

A. PAPINEAU-COUTURE

Hydrogen-ion control in paper plants. R. KARLBERG. *Svensk Pappers-Tid.* 32, 308-13 (1929). H-ion control in paper plants is not a new idea as evidenced by the early use of litmus paper in detg. the acidity of the pulp. Methods of detg. p_H and app. used therein are described. The applicability of p_H detns. in the pulp and paper industry is discussed. K. suggests a more detailed study on the relation of p_H to the resin content.

WILHELM SEGERBLOM

Hydrogen-ion control and pitch troubles in the paper mill. ROBERT KARLBERG. *Papier-Fabr.* 27, 358-62 (1929).—The paper machine stock in a mill experiencing serious pitch trouble varied between p_H 6.6 and 3.6 without apparent cause. Continuous control was established and it was found that holding the p_H between 4.4 and 5.0 by means of alum eliminated all trouble, even when a hard sulfite was used. When half of the alum was replaced by H₂SO₄ for a 5-day period, pitch appeared on the doctors and press rolls. This behavior is in agreement with the sizing theory of Roschier (C. A. 22, 3299). It is doubtful if the same limits would apply in all mills and under all conditions, thus, in this mill during the winter months the p_H could be allowed to run as high as 6 for several days without trouble. K. believes, however, that a careful study would improve conditions in any mill.

R. H. DOUGHTY

Economical use of water (in the paper industry). C. A. BLODGETT AND W. D.

SOMERVILLE. *Paper Mill* 52, No. 41, 15, 36(1929).—A discussion of the advantages derived from white recirculation and utilization. A. PAPINEAU-COUTURE

Domestic clays for filling and coating paper. OLIN W. CALLIGHAN. *Paper Trade J.* 89, No. 14, 74-9(1929); *Paper Mill* 52, No. 39, 12-3, 38, 40, 44; No. 40, 24-5, 40(1929).—A discussion of the merits of domestic (U. S.) clays over foreign (English) clays for filling and coating paper, with a description of their properties and methods of testing. A. PAPINEAU-COUTURE

China clay in relation to paper. J. EDINGTON AITKEN. *World's Paper Trade Rev.* 91, 2082-92(1929).—An address reviewing the function of china clay in paper, its prepn. and valuation. A. PAPINEAU-COUTURE

Detection of starch, glue and casein in and upon paper. T. C. BENTZEN. *Paper Mill* 52, No. 21, 20-1(1929); *Paper Trade J.* 88, No. 23, 59(1929).—Detailed directions are given for the detection of starch as surface sizing or loading by means of I soln. Glue and casein can be detected by the NH_4 molybdate ppt. Glue is tested for by means of 10% tannin soln., and casein, if present, will give a ppt. with NH_4 molybdate in the filtrate from the tannin-glue ppt. A. PAPINEAU-COUTURE

Determination of particle size of fillers for paper. HERSTAD. *Papir-Journalen* 16, 241-4(1928).—The most satisfactory results are obtained when the filler is kaolin of 20 μ to 30 μ . Of the many types of equipment for measuring particle size the best for this purpose is a sedimentation apparatus designed according to Wiegner-Gessner and equipped with automatic photographic equipment. A complete detn. can be made in one day covering fractions from 100 μ to 2 μ . C. E. PETERSON

Freeness. H. E. JORGENSEN. *Papir-Journalen* 16, 239-41(1928).—Freeness detns. as measured by instruments having different mesh screens are in a logarithmic relation to each other, and readings from one instrument may be converted to another by a straight-line graph on log paper. A graph is also presented to coordinate readings taken on an American freeness tester, with 3 or 4 g. pulp per l. and with a German "Mahlungsgrad" tester using 2 g. per l. C. E. PETERSON

Rosin-wax size. G. H. LAFONTAINE. *Pulp Paper Mag. Can.* 27, 970(1929).—A brief discussion of the advantages of rosin-wax mixts. over straight rosin for engine sizing. A rosin-wax emulsion suitable for sizing has been successfully prepd. and used for the last 4 yrs. A. PAPINEAU-COUTURE

Rosin sizing. ALMERON W. WICKHAM. *Paper Trade J.* 88, No. 24, 93, 94; *Paper Mill* 52, No. 24, 16; *Pulp Paper Mag. Can.* 27, 919-20; *Paper Ind.* 11, 657-8(1929). A brief address emphasizing the necessity for proper control of rosin sizing. A. P.-C.

Rosin sizing in paper making. C. E. MUELLER. *Paper Mill* 52, No. 23, 18, 20, 60, 62, 81; *Paper Trade J.* 88, No. 24, 79-82; *Pulp Paper Mag. Can.* 28, 219-20, 238-42(1929).—After a brief discussion of the effect of the p_H value of the stock, showing that the optimum p_H value varies according to mill conditions and the qualities required of the finished paper, a no. of examples are given of sizing troubles actually encountered in paper mill practice and of the ways in which they were eliminated. A. P.-C.

Paper sizing patent review. JOSEPH ROSSMAN. *Paper Trade J.* 89, No. 4, 54-60(1929).—A review of U. S. patents for engine sizing, with abstracts of patents from 1852 to July 31, 1928. A. PAPINEAU-COUTURE

The influence of size and alum on the coloring of paper in the beater with aniline dyestuffs. P. W. CARR. *Paper Maker & Brit. Paper Trade J. International No.*, 61-2(1929).—A very brief discussion of the effects of size and alum on the coloring of paper in the beater by means of basic, acid and direct dyes. A. PAPINEAU-COUTURE

The Delthirna rosin sizing process. E. HOCHBERGER. *Papier-Fabr.* 27, 83-91, 97-9(1929).—The novelty of the Delthirna process (I) (cf. Delacroix, C. A. 22, 4811) is mainly in the app. by means of which the rosin is brought into soln. with NaOH in the cold. The process is compared with the usual method of sizing (II) as regards economy and the properties of the sized papers as detd. by ink and NaOH size tests and p_H of the H_2O ext. Of 66 samples of Delthirna-sized paper, 22 were better, 5 equally well and 39 worse sized than comparable sheets sized in the usual way. Sheets of less than 50 g./sq. m. were poorly sized. The p_H of H_2O ext. from papers sized by I range from 4.5 to 5.8, that of papers sized by II from 5.5 to 5.8, indicating nonuniformity of sizing in I. If the alkali used in I is partially replaced by carbonate, the rosin content of the size decreases rapidly with increase in carbonate. The effect of diln. on p_H is also altered. Conditions governing pptn. and flocculation of the rosin were studied. It was found that in II the p_H of the liquid is lower, the $\text{Al}(\text{OH})_3$ higher, and the excess SO_2 considerably higher than in I. These and other effects are discussed in detail in the light of various theories of sizing. R. H. DOUGHTY

Fundamental principles of the Delthirna process. GERALD STRECKER. *Papier-*

Fabr. 27, 99-102(1929).—The novelty, efficiency and economy of the process (cf. preceding abstract) are defended. E. HOCHBERGER. *Ibid* 102-3.—Reply. R. H. D.

Bakelite sizing by the beater method. JOSEPH ROSSMAN. *Paper Trade J.* 89, No. 2, 61-2(1929).—A description of Bakeland's U. S. pat. 1,160,362, March 16, 1915, Redman and Cheetham's U. S. pat. 1,551,428 (C. A. 20, 267), and Haanen's U. S. pat. 1,630,424 (C. A. 21, 2385).

The gloss of paper: an exact method of determination. L. BLIN DESBLEDS. *Paper Maker & Brit. Paper Trade J.* 78, 151-5(1929); *International No.*, 36-9(1929).—A description of the T. C. B. photocolormeter, with a discussion of its merits as a means of measuring the gloss of paper. A. PAPINEAU-COUTURE

Determining the action of the Elmendorf (tearing test) apparatus. HANS NAGL. *Papier-Fabr.* 27, 421-4(1929).—The tear test is especially valuable in showing the extent to which the fibers have been shortened in processing. The same pulp beaten to 60° Schopper slowness in beaters with stone and with iron tackle gave, resp., 190 and 111 g. tear. In general, tensile strength and tear vary inversely. Calendering decreases the tear, while normal moisture variations are without definite effects. Basis weight and no. and width of strips torn affect the test. R. H. DOUGHTY

Beating. P. E. HODGSON. *Paper Ind.* 11, 479-83; *Paper Trade J.* 89, No. 3, 61-3; *Paper Mill* 52, No. 28, 20-4(1929).—It has been found in practice that rebuilt high speed beaters have the following advantages over the Hollander type beater; increased circulation, ensuring good mixing and uniformity of sizing and coloring; saving in power; greater production due to the combined effects of faster circulation; greater size of tub and higher stock consistency; quicker and easier dumping and higher roll speed. Exceptionally promising results have been obtained with a new type of vertical beater, built by Love Bros., Aurora, Ill., consisting of 10 vertically superposed sections, each of which comprises 1 rotating and 1 stationary disk, each provided with suitable knives or bars, the power consumption for a given strength development on bleached sulfate stock being about $\frac{1}{4}$ that required in an ordinary beater. The action of the beater roll is discussed to show how the vertical beater gives a proportionately much faster hydration and lower cutting effect than the Hollander type of beater. A. P.-C.

Effect of beating on the sizing strength of paper. J. BERGER. *Papier-Fabr.* 26, 5(1928).—See C. A. 23, 702, 3090. R. H. DOUGHTY

Beating in the hollander. WILH. GRÜTZSKY. *Papier-Fabr.* 27, 149-54(1929).—A discussion of the beater action and exposition of Ger. pat. 457,407. This describes a perforated beater roll in which a vacuum is applied ahead of the bed plate completely to fill the cells with pulp, and pressure applied across the bed plate and backfall section to force all the pulp in the cells against the bed plate knives and to force complete discharge over the backfall. This should give much increased power efficiency in the beater. R. H. DOUGHTY

The determination of chlorates in bleaching-hollander liquors. HERBERT PRELINGER. *Zellstoff Papier*, 8, 294-5(1928).—Excessive chlorate formation in bleaching indicates over-heating, and hypochlorite so consumed is wasted. Lunge's method for chlorates (reduction with excess FeSO_4 and detn. of the excess by KMnO_4) fails in waste bleach liquors because of the org. matter present. The following method of detn. is accurate to 0.03%, with a chlorate content of 0.5 gm. per l., and is unaffected by org. matter: With chlorates alone, reduce with SO_2 (reduction is instantaneous on warming), boil off the excess rapidly, add an excess of 0.1 N AgNO_3 and a few drops of HNO_3 , filter, wash, det. AgNO_3 in the clear filtrate by Volhard's method, and compute chlorate Cl by difference. If chloride is present, it is detd. first, then total Cl added on a sep. sample, after decompn. with SO_2 , and chlorate Cl found by difference. If hypochlorite is present, it is decompd. by alk. H_2O_2 , the excess H_2O_2 destroyed by boiling, and the procedure carried through as in the presence of chloride. R. H. D.

Influence of "Saftbraun" dyeing on the strength of paper. A. SCHLATTER. *Papier-Fabr.* 27, *Fest. u. Auslands-Heft*, 94-5(1929).—"Saftbraun" is obtained by treating a mixt. of brown coal and ocher with soda. When used for dyeing rough papers, the strength of the paper at first increases and then falls off. The following results were obtained with 0, 6 (max. strength) and 15%, resp., of dye: breaking length, m., 3644, 6800, 2431; Mullen bursting strength, kg., 1.5, 2.6, 1.9. The increase in strength is ascribed to the impregnating and binding effect of the dye. R. H. DOUGHTY

Production of waterproof tints in tissue papers by means of acid dyes. A. LANDOLP. *Papier-Fabr.* 27, 357(1929).—Acid dyes are preferred for the web dyeing of tissue and crepe papers since they may be obtained in brilliant and light-fast colors. They, however, run badly if wet. Investigation has disclosed that certain of these dyes, several of which are listed, do not form a lake when 400 cc. of 5% AlAc_3 is mixed

with 1000 cc. of 1% dye soln., and that sheets dipped in such a mixt. are dyed water fast. The test of fastness is that the dry sheets upon soaking for 10 min. in distd. H_2O do not color the water, and are unchanged in tint when redried. A rather strong drying is necessary for good fixation. Sheets colored in this way are somewhat harder in feel than normal, which is also an advantage.

R. H. DOUGHTY

Goldenrod shades on paper. J. A. MELTZER. *Paper Maker & Brit. Paper Trade J. International No.*, 96(1929).—Methods are given for using the following National dyes for productions of goldenrod shades: Solantine yellow FFP conc., Erie yellow YP, Erie yellow S2GP conc., Erie yellow SGP, Erie yellow SRP conc., Metanil yellow P conc. and Auramine OP conc.

A. PAPINEAU-COUTURE

The whiteness of paper. L. BLIN DESBLEDS. *World's Paper Trade Rev.* 92, 754-8 (1929).—A brief description of the photolec photocolorimeter for detg. the whiteness of paper.

A. PAPINEAU-COUTURE

Slime prevention and shrinkage. D. K. PATILLO. *Paper Mill* 52, No. 38, 18, 26 (1929).—A brief discussion of the harmful effects of slime in paper making and of the advantages of preventing slime formation by appropriate chlorination treatment. An important advantage is the possibility of using a closed white-water system, particularly in conjunction with suitable coagulating treatment, for which purpose chlorinated copperas, Na aluminate and alum are particularly suitable.

A. PAPINEAU-COUTURE

Shrinkage. AUBREY T. TAYLOR. *Paper Trade J.* 89, No. 14, 84 5(1929).—A brief outline of the shrinkage loss at the mill of the Bedford Pulp and Paper Co., Big Island, Va., and reduction by installation of save-alls and reduction of the amt. of fresh water used on the paper machine showers. Measurement of the mill effluent and detn. of its fiber content accounted for all but about 3% of the shrinkage.

A. P.-C.

White water. A. W. PESCH. *Paper Mill* 52, No. 40, 16, 31(1929).—A brief discussion of the importance of white water losses and the methods of evaluating them.

A. PAPINEAU-COUTURE

Agents for washing and cleaning (paper-machine) felts and wires. AUGUST NOLL. *Papier-Fabr.* 27, 154-7(1929).—The compn. and recommendations for use of 20 trade-named materials are given.

R. H. DOUGHTY

Chemical determination of wool in felt papers. BRUNO SCHULZE. *Papier-Fabr.* 27, 299-301; *Wochbl. Papierfabr.* 60, 545 7; *Zellstoff Papier* 9, 610 11(1929).—Microscopic estn. of wool fiber is very difficult. Two gravimetric methods are in use in the industry, in which either the wool is dissolved in 2% NaOH (I) or the non-wool fibers are dissolved in 80% H_2SO_4 (II), the insol. residue being weighed. Both methods were tested on various pure fibers and on known mixts. of fibers. The results of I were invariably several percent too high; the error with II was less than 0.5%, except with pure jute (0.8% high) and mech. pulp (2.1% high). The method is as follows: A 10-g. sample is boiled with water to sep. the fibers, filtered on a fine mesh wire, shaken with 96% alc., filtered as rapidly as possible and treated with 300 cc of 80% (60.9° Bé.) H_2SO_4 in a stoppered flask. The mass is shaken for an hr. with brief pauses and at 15 min. intervals for 2 hrs. more, dild. with a l. of water, and filtered through a fine wire cloth. The wool residue is washed with dil. alkali, with water until neutral, and dried at 100-105°. The weight obtained must, in industrial work, be corrected for ash content.

R. H. DOUGHTY

Paper stock feed regulators. JOSEPH ROSSMAN. *Paper Trade J.* 89, No. 7, 63 74 (1929).—A review of U. S. patents.

A. PAPINEAU-COUTURE

Kolitsch automatic stock feed regulator. AUGUST KOLITSCH. *Paper Trade J.* 89, No. 8, 54(1929).—A description of U. S. pat. 1,695,380 (C. A. 23, 983).

The Van de Carr consistency regulator. C. R. VAN DE CARR, JR. *Paper Trade J.* 88, No. 23, 66-7(1929).—A description of U. S. pat. 1,665,425 (C. A. 22, 1854).

A. P.-C.

Stock loss determinations. D. S. DAVIS. *Paper Ind.* 11, 647(1929).—An alignment chart is given which may be used to calc. stock losses from white water weir and consistency measurements.

A. PAPINEAU-COUTURE

The manufacture and use of rubber rolls (for paper machinery). GUSTAV BECKER. *Papier-Fabr.* 27, 171-7(1929).—Descriptive, with illustrations.

R. H. DOUGHTY

Lubricants for paper mills. ERNST W. STEINITZ. *Papier-Fabr.* 27, 268-72(1929).—The importance of adopting proper lubricants (with specifications) for various uses is emphasized.

R. H. DOUGHTY

A new gum-coating machine. ARTHUR B. GREEN. *Paper Trade J.* 89, No. 8, 45-7 (1929).—The drawbacks of the festoon dryer and of the Crowell dryer are briefly discussed. They have been overcome by designing a double-loop dryer in which the paper after gumming is carried over 2 wheels, 20 ft. in diam., which are completely enclosed

in a highly insulated, uninterrupted, tight construction, affording the max. thermal efficiency.

Apparatus for testing paper machine wires. RENÉ ESCOURROU. *Papier* 32, 409-13; *Paper Trade J.* 89, No. 3, 59-61(1929).—An app. is described in detail by which, in comparing samples of different wires, the loss in wt. is detd. The loss in draining qualities of the wire at any given stage in the test can be detd. by measuring the rate of flow of a standard vaseline oil and comparing it with the rate of flow for the same wire before the test.

A. PAPINEAU-COUTURE

Recovery and reuse of mill effluents. R. H. CLAPPERTON. *World's Paper Trade Rev.* 92, 142-6(1929).—A brief description of the Marx funnel filter (sedimentation save-all) and discussion of its merits.

A. PAPINEAU-COUTURE

Corrosion-resistant steels for the (paper) industry. JOHN A. MATTHEWS. *Paper Trade J.* 88, No. 21, 79-81(1929).—Tests carried out on upwards of 20 different alloys (both ferrous and non-ferrous) by total immersion in com. sulfite liquor during periods extending from 10 to over 100 cooks (150-2800 hrs) showed that: the non-ferrous metals, as a class, so far as yet tested, are unsatisfactory and by no means equal to several of the ferrous alloys; some of the ferrous alloys are unsatisfactory, but of the ferrous alloys the range of analyses covered showed conclusively that a high Cr content, such as a stainless steel of 24% Cr, is extremely resistant; a high Cr content with relatively low Ni content is also satisfactory; where the Ni is much higher than the Cr, the results are not satisfactory. The rate of corrosion in the satisfactory samples is best exemplified by saying that the rate of penetration was of the order of 0.01 in. in depth per yr. The max. rate of corrosion of a no. of stainless steels and of "rezistals" (highly resistant alloy steels made by the Crucible Steel Co.) by black liquor was of the order of 0.002 in. penetration per yr.

A. PAPINEAU-COUTURE

Analytical recognition of the metal-corroding power of papers. I. KALB AND F. F. VON FALKENHAUSEN. *Papier-Fabr.* 27, 330-3(1929).—It is shown that resin acids do not attack metals, the actual acidity of paper being the cause of such attack. All metals are not affected in the same way; Cu foil was used in this study, and the paper was considered satisfactory if the metal showed no attack after 10 weeks contact in an atm. of 90% relative humidity. Results obtained by extg. the paper and titrating the ext. showed no definite relation with those of the corrosion test. With the Wulff colorimeter foils it was shown definitely that papers with a p_H above 5 would not corrode Cu. Papers treated with known amts. of ZnS attacked Cu readily, but if equal amts. of ZnO were added, the attack was entirely prevented. The crit. p_H in the S-contg. papers was not established, but it, and not titrable acidity, is the controlling factor in the corrosion of metals by papers.

R. H. DOWGITY

Determining the transluence of paper. W. HOLWECH. *Paper Trade J.* 89, No. 10, 55-8; *Papier-Fabr.* 27, 37-45(1929).—A math. theoretical discussion of the absorption of light by paper, with an explanation of the use of the König-Martens polarization photometer for measuring the absorption coeff.

A. PAPINEAU-COUTURE

The measurement of the contrast ratio of opaque and translucent papers. JAMES D'A. CLARK. *World's Paper Trade Rev.* 92, 996-1004(1929).—The "contrast ratio" is considered to be the best measurement to est. the printing quality of paper. The U. S. Bur. of Standards instrument for detg. it is suitable for papers of which the contrast ratio is not much above 0.85 (about the ratio for a medium wt. bond); but for more opaque papers the range of 0.85-1.00 is covered by only 2.3° of arc, and as most newsprint papers lie between 0.90 and 0.95, or only 0.9° of arc, the method is unsuitable for accurately measuring their opacity. The following simple and convenient method has been devised for measuring the contrast ratio of opaque papers: A piece of paper, made from materials which change very little, the color and texture of which approx. to the av. of samples to be tested, and having a contrast ratio of about 0.85, or slightly greater, is selected as a substandard (a fairly opaque, dull-colored bond paper of slightly yellowish cast is very suitable). Its contrast ratio is very accurately detd. by the ordinary method with a large no. of readings. A special attachment to replace the black and white areas of the Bur. of Standards instrument by a uniformly illuminated glass screen is inserted and the substandard, together with the sample to be measured, is placed in the holder of the instrument so that each paper covers one-half of the photometer field. If the fields are matched by rotating the arm of the photometer and the sample has the same opacity as the substandard, the setting of the instrument will be 45°, and if the sample were perfectly opaque the reading would be 9°. If the substandard has a contrast ratio of 0.86, the range 0.86-1.00 is thus covered by 45° of the photometer scale, instead of about 2.2° by the usual method.

A. PAPINEAU-COUTURE

Manufacture of safety paper. J. ROSSMAN. *Papier-Fabr.* 27, 295-9(1929).—Summary of U. S. patent literature; cf. C. A. 22, 4813. R. H. DOUGHTY

The buffer process for sized liner paper board. A. W. WICKHAM AND R. W. SHAFFER. *Pulp Paper Mag. Can.* 27, 920-1; *Paper Trade J.* 88, No. 24, 92, 94; *Paper Mill* 52, No. 25, 5, 37(1929).—The process is intended primarily for prevention of desizing of the liner, and consists essentially in maintaining a slight acidity of the stock in the vat next to the liner by adding alum (by means of a dry feeder) to the stock forming the ply next to the sized liner, the alum being added preferably at the screen. The advantages claimed are: It prevents entrance to the liner of the alk. water squeezed from the filler plies at the presses, thus preventing desizing of the liner; it produces a freeing action of the stock, thereby making it possible to dry the board more readily; the flocculent $Al(OH)_3$ pptd. on addn. of the alum entrains such of the size-alum ppt. as was made in the beater but which was not firmly attached to the fibers of the liner stock, thus enhancing sizing efficiency; it gives more uniform sizing, decreased cost of sizing, better formation, increased strength, more uniform color and increased production. A. PAPINEAU-COUTURE

Insulating board from corn stalks. WARREN E. EMLEY. *Paper Trade J.* 88, No. 25, 61-2(1929).—A brief outline of the semi-com. exptl. work carried out by the U. S. Bureau of Standards, in cooperation with Iowa State College, during the last 2 yr. A. PAPINEAU-COUTURE

The use-requirements of chip board. G. R. WYMAN AND R. A. WILKINS. *Paper Trade J.* 88, No. 22, 43(1929).—A brief outline. A. PAPINEAU-COUTURE

A study of fiber wall boards for developing specification standards. B. W. SCRIBNER AND F. T. CARSON. *Paper Trade J.* 89, No. 13, 61-8(1929).—Results are given of a study of vegetable fiber wall boards undertaken by the Paper Section of the U. S. Bur. of Standards in connection with the formulation of purchase specifications for this product. Suggestions based on the tech. information compiled are made to assist those who wish to write purchase specifications for fiber wall boards. One specification covering both laminated and homogeneous boards appears to be feasible. The properties considered important in evaluating the quality of the boards are strength, water absorption and expansion; and from consideration of the av. quality of com. brands in use, as shown by lab. data, the following requirements are suggested: flexural bending strength not less than 10 lb. for the shorter direction of the board; water absorption not more than 65% of the original wt. of the board; expansion not more than 0.7% in the shorter direction of the board. The methods to be used for testing are described. These requirements are well within the limits of most of the com. products in use at the present time and are believed suitable for the purchase of boards of good av. quality. A. PAPINEAU-COUTURE

Essential requirements of test liner for making a satisfactory container. H. C. McDANIEL. *Paper Trade J.* 88, No. 22, 48-9(1929).—A discussion of the essential properties of test liners: caliper, wt. per 1000 sq. ft., finish, Mullen test, tensile strength, waterproofness, folding quality. A. PAPINEAU-COUTURE

Requirements for fiber containers in service. C. A. PLASKETT. *Paper Trade J.* 88, No. 22, 46-8(1929); *Pulp Paper Mag. Can.* 28, 367-8, 382-6(1929).—A discussion of the causes of failure of fiber containers and of the qualities required to withstand these causes; also of the effects of scoring processes and of sealing processes on the strength of fiber boxes. A. PAPINEAU-COUTURE

The properties of corrugating board for satisfactory use in fiber containers. WILSON W. GALLOWAY. *Paper Trade J.* 88, No. 23, 68(1929).—The qualities necessary in a sheet of corrugating straw board to make it successful in use are: well-made roll, stiffness, ability to take steam, tensile strength, ability to hold silica, ability to bend in the arch without cracking, proper wt. per 1000 sq. ft., proper H_2O content and proper caliper. A. PAPINEAU-COUTURE

Causes and prevention of deterioration in book materials. ROBERT P. WALTON. *Paper Trade J.* 89, No. 6, 53-8(1929).—See C. A. 23, 3343. A. PAPINEAU-COUTURE

Disposal of industrial wastes (RUE) 14. Waste heat in cement mills and paper mills (SMITH) 20.

Cellulose from highly lignified plants such as bamboo or beechwood. ROLAND RUNKEL (to Verein für Chemische Industrie A.-G.). U. S. 1,731,112, Oct. 8. The raw material is comminuted and chemically softened (suitably by treatment with alkali soln.) at atm. pressure, chemically reduced to fiber, and the fibers are subjected to successive multi-stage oxidation and chlorination, as by treatment with gaseous Cl_2 .

Cellulosic fiber liberation. GEORGE A. RICHTER (to Brown Co.). U. S. 1,730,383, Oct. 8. Raw cellulosic material such as wood is digested under fiber-liberating conditions in a sulfurous acid soln. contg. Na-B salts, such as borax, which serve to facilitate production of high-grade pulp and regeneration of the liquor.

Apparatus of the Jordan type for refining fiber stock. JOHN A. WIENER. U. S. 1,730,908, Oct. 8. Structural features.

Conditioning cellulose for production of derivatives such as nitrocellulose. GEORGE A. RICHTER, MILTON O. SCHUR and ROYAL H. RASCH (to Brown Co.). U. S. 1,729,628, Oct. 1. Wood pulp is beaten to about the slowness of pulp used in bond paper manuf. preliminary to its conversion into derivs. such as nitrocellulose for films, lacquers, artificial silk, etc. The preliminary treatment serves to facilitate production of "lower" nitrated cellulose of desired properties. U. S. 1,729,629 specifies removing fine, short and broken fiber from pulp, deresinifying and cleansing the removed material, and nitrating.

Refining raw wood pulp. MILTON O. SCHUR (to Brown Co.). U. S. 1,730,386, Oct. 8. A lime-digested pulp is deresinified and then bleached.

Processing cellulosic fiber. MILTON O. SCHUR and ROYAL H. RASCH (to Brown Co.) U. S. 1,730,387, Oct. 8. Cellulosic material such as wood pulp freed from encrusting substances is treated with org. solvents such as alc. and CCl_4 to remove resinous impurities. An arrangement of app. is described.

Bleaching chemical wood pulp. LINN BRADLEY and EDWARD P. MCKEEFE (to Bradley-McKee Corp.). U. S. 1,730,315, Oct. 1. Pulp in a flowing condition and contg. only a small quantity of cellulose material in a large quantity of water is brought into direct contact with gaseous Cl and permitted to flow through an atm. of Cl. An app. is described.

Apparatus for straining pulp fibers. LEMUEL B. DECKER. U. S. 1,731,193, Oct. 8. Structural features.

Paper manufacture. ARTHUR L. KENNEDY (to Plastic, Inc.). U. S. 1,730,009, Oct. 1. See Can. 280,789 (C. A. 22, 3045).

Impregnated paper hood caps for milk bottles, etc. CARLETON ELLIS. U. S. 1,731,194, Oct. 8. A single-ply skirted paper cap is made from paper stock contg. a considerable proportion of groundwood, and carries a binder of a quick-setting wax such as a wax and resin mixt. U. S. 1,731,195 also relates to skirted caps hot-crimped around the bottle rim and carrying a fusible material such as a wax and resin mixt., which gives sufficient adherence to the bottle for ordinary handling while permitting ready removal.

Paper hood cap for milk bottles, etc. CARLETON ELLIS (to Ellis-Foster Co.). U. S. 1,730,563, Oct. 8. The material is treated with a Mg stearate compn. or other water resistant binder contg. an insol. soap and substantially free from water-sol. soap. U. S. 1,730,564 specifies a hood cap of stiff paper crimped over the top of the bottle and impregnated with a mixt. of rosin, paraffin and carnauba wax or other binding compn., which, on undue rise in temp., loses its binding character, permits sepn. of the cap from the head of the bottle top and thus serves as an indicator of the bottle and contents having been exposed to temps. above those suitable for keeping milk and cream in good condition.

Multi-ply paper board. LEVIS M. BOOTH (one-third each to Almeron W. Wickham and Ralph W. Shaffer). U. S. 1,729,992, Oct. 1. In the manuf. of multi-ply paper board in which one or more of the liner plies are sized, acid material such as $\text{Al}_2(\text{SO}_4)_3$ is added to such of the filler stock as is supplied to the filler vat which is next to the liner vat prior to the delivery of the stock to the paper machine vat.

Electrical temperature-indicating device suitable for use on paper calendering rolls, etc. CHARLES B. THWING (to Thwing Instrument Co.). U. S. 1,730,308, Oct. 1. Structural features.

Symposium—explosives manufacture. *J. S. African Chem. Inst.* 10, No. 2(1927). Advances made in nitroglycerin manufacture at Modderfontein. G. F. AYERS. *Ibid* 3 5. These advances chiefly were the use of chilled brine in nitration, improvements in proportions and strength of nitrating acids and the use of accelerators and retarders in the after separation. **Acid pumping.** M. S. SALOMON. *Ibid* 6.—The acid egg and the

montejus have been replaced by direct-drive cast-iron centrifugal pumps for mixed acids, spent acids, oleum and H_2SO_4 down to 70%. For weaker H_2SO_4 the pumps are made of Ceratherm. For HNO_3 , pumps are made of an alloy of Pb and Sb. **Pure acid.** M. S. SALOMON. *Ibid* 7-9.—Pure acid is made from oleum by distn. in steel vessels. Surface cooling of this acid is discussed. **Recent developments in manufacture.** T. T. WOOD. *Ibid* 10 2.—Deals with HCl and salt cake, acid-resisting metals, condensation of HNO_3 , and the combined process of denitration of nitroglycerin waste acids and the concn. of weak HNO_3 . **The analysis of nitroglycerin waste acid.** A. S. WEBB. *Ibid* 13-4. **A thermohydrometer.** A. S. WEBB. *Ibid* 14-5.—This is constructed like the common hydrometer but the large bulb is filled with a colored liquid which rises or falls in the stem of the hydrometer with the changes in temp. **Advantages of displacement over the dipping process for the nitration of cotton.** D. I. ALLAN. *Ibid* 16 7. **The estimation of azides.** D. A. COPEMAN. *Ibid* 18 22.—The azide is treated with a soln. of ceric ammonium nitrate and the N set free is collected in an azotometer. **Contact processes—sulfur and pyrites burners.** W. J. P. SUTHERLAND. *Ibid* 23-6.—A general review of known practice. CHARLES E. MUNROE

Developments in the explosives industry in Great Britain during 1927 and 1928. JOHN WEYR. *Z. ges. Schiess Sprengstoffw.* 24, 218 9(1929).—The article is a brief résumé of progress in development of *initiating explosives*, *industrial explosives*, *military explosives* and in the *testing of explosives*. The increased use of PbN_3 in detonators and of *glycol nitrate* in low-freezing dynamites is especially noted. C. G. STORM

Seventh annual report of the Safety Mines Research Board for 1928. EDWARD TROUP, et al. *Safety Mines Research Board (London) 7th Annual Rept 1929*, 88 pp.; *Colliery Guardian* 139, 906-10(1929).—The amt. of volatile matter in a coal is a rough measure of the relative flammability of its dust as detd. by the amt. of incombustible dust necessary to mix with it to suppress ignition. With high-volatile coals each % of fire damp in the air required that the amt. of incombustible dust to suppress ignition be increased by 5%; with low-volatile coals the effects of the presence of fire damp were more marked. For a lab. test of flammability a mixt. of coal dust and inert dust, both of standard fineness, is blown by a puff of O through a vertical furnace at 700°. Flammability depends mainly upon reactivity of the ulmin constituents of coal. Coal dust blown by a fan into an insulated metal pipe gives the latter a high charge, and sparks therefrom may ignite fire damp. Small traces of NO_2 lower considerably the ignition temp. of CH_4 . The hot, gaseous product from explosives may be of importance here. High-frequency vibrations from a CH_4 flame may raise a cloud of dust. If a constriction be in the flame path, very high pressures can occur. E. M. SYMMES

The explosive properties of "Chloratite 3" with varying content of petroleum. A. HAID AND H. SELLE. *Z. ges. Schiess-Sprengstoffw.* 24, 251 2(1929).—The petroleum content of this *chlorate explosive* was varied from 0 to 16%, and the effect measured by detns. of sensitiveness to impact, by transmission of detonation through air gap, by rate of detonation, and by the effect on Pb blocks and Cu cylinders. From a summary of the results of all tests it is concluded that the most favorable content of petroleum is 8.9%. C. G. STORM

Ignition of fire damp. H. F. COWARD AND R. V. WHEELER. *Safety Mines Research Board (London) Paper No. 53*, 40 pp (1929).—Mixts. of fire damp and air of suitable compn. ignite when a sufficient vol. is kept at sufficient temp. for a sufficient time. These 3 factors are dependent upon one another, e. g., a mixt. raised to ignition temp. may be unaffected for 10 sec., then ignite suddenly. The question as to which is the most easily ignitable mixt. of CH_4 and air can be answered only when the means of ignition are specified. Heated surfaces are less dangerous than lamp flames. Elec. sparks are the more dangerous the more rapidly their energy is communicated to the flammable mixt. Capacity sparks are more dangerous than inductance sparks, and a. c. and d. c. act alike. E. M. SYMMES

Ignition of fire damp by the heat of impact of metal against rock. M. J. BURGESS AND R. V. WHEELER. *Safety Mines Research Board (London) Paper No. 54*, 25 pp (1929); cf. C. A. 22, 3047; 23, 935.—A steel block pressed against a revolving Carborundum wheel did not ignite fire damp but did fire CS_2 and thin tissue paper. A steel block pressed against a steel wheel driven by 5 h. p. gave no ignition. Fire damp ignited from the heated edge of a steel rod pressed against a rapidly revolving wheel of hard quartzitic sandstone driven by 1-1.5 h. p. Other hard rocks caused no ignition. A 12" cutting disk with 40 W steel cutters gave ignition with certain rocks; this was not to sparks but to heated areas. Coal-cutter picks on the periphery of a rapidly revolving wheel caused ignition for the same reason. A chain coal-cutter cutting hard rock gave ignitions at a cutting speed of 0.75-18" per min., depth of cut 3-5". E. M. SYMMES

The danger of fire and explosion with acetylene. W. RIMARSKI. *Z. angew. Chem.* **42**, 933-6(1929).—The Borsigwalde fire and explosion were due to a leak in the filler manifold, which ignited by elec. spark, casting no reflection upon the safety of C_2H_2 cylinders in use at present. The latter have, in Germany, stricter supervision than in other countries. Details of routine tests and past inflammability investigations are given.

E. M. SYMMES

Dissolved acetylene. I. W. RIMARSKI. *Chem.-Ztg.* **53**, 725-7(1929).—A description of the official tests of C_2H_2 containers.

E. M. SYMMES

The quenching of flames in atmospheres of a certain composition and at the limits of explosion regions. W. P. JORISSEN AND B. L. ONGKIEHONG. *Rec. trav. chim.* **48**, 1069-74(1929); cf. *C. A.* **21**, 1215.—A continuation of J. and O.'s investigations on explosion regions. Curves are given showing the explosion regions of H_2 -air- CO_2 , CO -air- CO_2 , CH_4 -air- CO_2 , C_2H_4 -air- CO_2 , C_2H_2 -air- CO_2 , N_2 - O_2 - NH_3 and N_2 - O_2 - C_2H_5Br mixts., in which the O_2 contents of the atms. were detd.

H. W. LEAHY

The recovery of solvents in powder factories. OTTO KREBS. *Z. ges. Schiess-Sprengstoffw.* **24**, 215-8(1929).—An app and method for the recovery of $EtOH$ and H_2O in the drying of smokeless powder are described. The solvent is removed from the powder by an air current heated to 50° , the vapors being absorbed by H_2O in washers and recovered in distn. app.

25—DYES AND TEXTILE CHEMISTRY

L. A. OLNEY

Laboratory fastness tests for dyestuffs. KENNETH MARSDEN. *Dyer, Calico Printer* **62**, 259, 313(1929).—Simple practical tests are described for testing fastness to mulling, washing, light, chlorine, acids, alkalis, potting and stoving.

R. K. W.

The analytical quartz lamp as an aid in textile testing. A. SOMMER. *Wochbl. Papierfabr.* **60**, 9-13(1929).—Various uses for the lamp are outlined, and a list of the fluorescent colors of various fibers is given. The fluorescence in ultra-violet light of vegetable fibers depends upon the kind and amt. of incrustants present, and therefore may be useful in identifying types of fibers, or in measuring the degree of bleaching or detecting over-bleaching. It may also be of use in testing dyes. Unfortunately its use has not been sufficiently studied as yet to permit more than limited and qual. application.

R. H. DOUGHTY

Application of cutch and protection of vegetable fibers against marine influences. JAMES W. DURANT. *Dyer, Calico Printer* **62**, 133-5, 217(1929).—The use of linseed oil, mixts. of wax and oil, and of waxes and various emulsions as protective agents is described.

RUBY K. WORNER

How rayon may be successfully processed in the bleachery. THOMAS F. HUGHES. *Textile World* **76**, 1155-6, 1177(1929); cf. *C. A.* **23**, 701.—Practical.

R. K. W.

The mercerization of cotton goods containing artificial silks. A. J. HALL. *Ind. Chemist* **5**, 355-7(1929).—See *C. A.* **23**, 5323.

E. G. R. ARDAGH

Sunn hemp. S. D. TIMSON. *Rhodesia Agr. J.* **26**, 668-82(1929).—*Crotalaria juncea* was studied thoroughly. The av. Sunn hemp crop is about 10 tons per acre and contains 53% H_2O . The dry matter of the entire plant contains N 2.31, P_2O_5 0.26 and K_2O 1.26%. The compn. of the seed is: H_2O 8.6, protein 31.2, other compds. contg. N 3.4, fat 4.3, starch 41.1, fiber 8.1 and ash 3.3%. The seed does not contain cyanogenic glucosides but gives reactions suggesting the presence of some unidentified alkaloid.

A. L. MEHRING

Determination of wool shrinkages by sample scouring. J. F. WILSON. *Textile World* **76**, 1463-5(1929).—A system of scouring small samples of wool has been devised which gives results comparable to the usual 3- or 4-bowl scouring vat. The wool is put through a cone-type duster 3 times to open the tip and thus facilitate the penetration of the bath. For the scourings, 5 Cu trays fitted with hot and cold water, gas and drain are used. A smaller tray with a screen bottom drops into the larger tray. In between "baths," the sample is put through a heavy laundry wringer, and the process is repeated

until the wool is scoured. A new type of drier, especially designed to handle small quantities of scoured wool, has been developed. The device employs a combination of centrifugal force and hot air blast. Three to 5 min. is required for reducing a 100 to 125 g. sample from complete satn. to less than air dryness. RUBY K. WÖRNER

The application of the azoic colors to wool and union goods. J. A. WALLWORK. *Dyer, Calico Printer* 62, 190-1, 277 (1929).—Directions and formulas are given.

RUBY K. WÖRNER

Influence of "Saftbraun" dyeing on the strength of paper (SCHLATTER) 23. A special case of syneresis [in dye preparation] (JACOBY) 2. Fast colors for leather (LAMB) 29. Chemical determination of wool in felt papers (SCHULZE) 23. Dye composition for leather (U. S. pat. 1,729,938) 29. Ketones of the anthracene series [for dye production] (U. S. pat. 1,730,081) 10. Rubber-coated fabric suitable for ornamenting cloth (U. S. pat. 1,730,665) 30. Waterproof wrapping cloth (U. S. pat. 1,729,681) 13. Mo phosphotungstate compounds (for lake manufacture) (U. S. pat. 1,731,081) 18.

Indigoid dyes. ERWIN HOFFA, HANS HEYNA and FRITZ MÜLLER (to General Aniline Works). U. S. 1,730,209, Oct. 1. A 4,5,6,7-tetrahalo-3-hydroxy-1-thionaphthene is condensed with a cyclic α -diketone such as 5,7-dichloroisatin. Dyes thus formed, which are described, give brown and violet tints on cotton.

Vat dyes. HERMANN WAGNER, RUDOLF BRÜNE, MAX HESSENLAND, ERWIN HOFFA, FRITZ MÜLLER and HANS HEYNA (to General Aniline Works). U. S. 1,730,699, Oct. 8. Several examples are given of the production of dyes giving fast blue, violet or brown dyeings on cotton and having the general formula

wherein C_1 represents a C atom belonging to the 5-membered nucleus of an isatin compd. and X represents H which may be replaced by halogen. These dyes are obtainable by condensing 4-methyl-5,6-dihaloxythionaphthene with an isatin compd. and halogenating the reaction product if desired.

Trisazo dyes. HUGO SCHWEITZER and JOHANN HUISMANN (to General Aniline Works, Inc.). U. S. 1,730,692, Oct. 8. Dyes of the general formula:

wherein R and R_1 represent aryl nuclei and Y represents H or an aryl nucleus are obtained by coupling the diazo compd. of a secondary disazo dye contg. in the end position the radical of a 1-amino-2-naphthol ether with a 2-amino-5-naphthol-7-sulfonic acid compd. They are generally dark powders sol. in water with a bluish green and in concd. H_2SO_4 with a blue coloration, dyeing cotton in clear greenish blue shades of good fastness.

Tetrazisazo dyes. WINFRID HENTRICH and MAX HARDTMANN (to General Aniline Works). U. S. 1,730,207, Oct. 1. Numerous examples are given of the production of dyes of the general formula

wherein R_1 and R_2 represent aromatic residues, R_3 represents a residue of the naphtha-

lene series, R_4 a residue of any suitable end component, XH , an alkyl or acyl group and YH or any univalent substituent. They dye cotton fast, clear green shades.

Yellow monoazo dyes. HERMANN WAGNER and ERICH FISCHER (to General Aniline Works). U. S. 1,730,179, Oct. 1. By coupling a diazo compd. from an aniline-sulfonic acid with 1-(2'-chloro-5'-sulfophenyl)-3-methyl-5-pyrazolone yellow monoazo dyes are obtained which are readily sol. in water and dye wool very even tints fast to water. The dycings are of clear green fast to light. Several examples are given.

Yellow dyes for wool. EMILE REBER and JOSEPH SPIELER (to Soc. anon. pour. l'ind. chim. à Bâle). U. S. 1,731,150, Oct. 8. Azo dyes of the general formula: acidyl-NH—R—N=N—P where in R means an aryl nucleus of the benzene series which contains a sulfonic group in *o*-position and the acidyl-NH group in *m*-position to the azo group, and wherein P means the residue of a 1-aryl-5-pyrazolone, are obtained by coupling diazo compds. of the general formula: acidyl—NH—R—N=N—OH, wherein R has the above mentioned signification, with 1-aryl-5-pyrazolones, form yellow to brown and orange-yellow powders, dissolving in water on addn. of Na_2CO_3 soln. with yellow color, and dye wool in equal yellow tints which are of good fastness to alkali and light. According to the choice of the components, dyes are obtained which are fast not only to water but also to acid fulling and to alkali and, under certain conditions, have good fastness to washing. Even the 1-aryl-5-pyrazolone-3-carboxylic acids, which have yielded hitherto azo dyes of color strength but only moderately equalizing power, give rise to products which are excellently equalizing and fast.

Cotton dyes of the anthraquinone series. FRITZ BAUMANN (to General Aniline Works). U. S. 1,730,186, Oct. 1. Several examples are given of the production of dyes having the general formula:

wherein one x and one y stand for benzoylamino groups, at least one x or one y for an alkoxy group and the remaining x 's and y 's for H, well-crystg. compds., sol. in concd. H_2SO_4 with a generally dull olive-green to blue-gray color, which changes soon into a red-brown to orange red to red color.

Resists used in dyeing. JULIUS HÖPKER (to General Aniline Works). U. S. 1,730,211, Oct. 1. The material to be dyed is printed with a mixt. of an oxidizing agent such as $Na_2Cr_2O_7$ or Na *m*-nitrobenzenesulfonate and an aq. soln. of a methyl ether of cellulose, dried, and dyed in vat liquor.

Apparatus with perforated pipes for dyeing thread packages. CHARLES K. DUNFORD (to Sonoco Products Co.). U. S. 1,730,320, Oct. 1. Structural features.

Apparatus for dyeing or treatment of yarn in skeins. NOAH WALKER and EUGENE H. DAVIS (to Walker & Davis, Inc.). U. S. 1,730,025, Oct. 1. Structural features.

Soap baths for treating textile materials. FRITZ GÜNTHER and JOSEPH NÜSSLEIN (to I. G. Farbenind. A.-G.). U. S. 1,730,037, Oct. 1. A naphthalenesulfonic acid contg. alkyl groups with at least 3 C atoms, e. g., isopropyl-naphthalenesulfonic acid, is used in soap baths for the purpose of increasing their wetting and penetrating power in dyeing or other processes.

Treating vegetable, animal or artificial fibrous materials with emulsions, spinning oils or fats, etc. JOHANN G. KÄSTNER. U. S. 1,730,430, Oct. 8. A highly colloidal and highly viscous org. substance such as a tragacanth soln. or a decoction of carob bean kernels is added to the usual emulsions, spinning oils or fats.

Composition for impregnating balloon fabrics. ERICH TRECKMANN and BRUNO TRECKMANN (to Luftschiffbau Zeppelin, G. m. b. H.). U. S. 1,730,544, Oct. 8. Gelatin or a like substance is used with about an equal quantity of Turkey red oil, about 10 times its quantity of water and about half its quantity of glycerol.

26—PAINTS, VARNISHES AND RESINS

A. H. SABIN

The viscosity of oil paints. HANS WOLFF. *Farben-Ztg.* **34**, 2990-1 (1929).—The viscosity of a paint prepd. by thinning a stiff paste with oil is less than that of a paint prepd. by thinning a thin paste to the same percentage of oil and pigment. The difference is greater for paint contg. a relatively small amt. of oil. The crit. points (C. A. **23**, 5333) of both types of paint lie close together and may be considered a const. of the pigment. G. G. SWARD

Rust prevention by the use of oil paints: theoretical and practical considerations. J. HAUSEN. *Papier-Fabr.* **27**, 103-6 (1929).—A general discussion of the importance and the mechanism of the protection of iron work by paints. Five years is given as the av. life of paint coatings at present. The nature and phys. structure of the pigment particles play an important part in the formation of a protective film, a variety of sizes being better than a uniform size, and rough or irregular particles being better than smooth round ones, from the viewpoint of effectiveness and permanence of the coating. Brief mention is made of testing methods in use. R. H. DOUGHTY

Determination of zinc oxide in paints. EDWARD J. DAVIS. *Chemist-Analyst* **18**, No. 4, 11 (1929).—Boil 1 g. of pigment with 50 cc. of satd. NH_4Cl soln. and 35 cc. of 15 N NH_4OH for 5 min. Test the residue for Zn. Titrate the filtrate, which usually contains all of the Zn, with $\text{K}_4\text{Fe}(\text{CN})_6$. W. T. H.

Oil absorption of pigments. W. VAN WÜLLEN-SCHOLTEN. *Farben-Ztg.* **34**, 2940-1 (1929).—W. conducts the Gardner-Coleman method with a glass rod instead of a spatula. Some typical results are given. G. G. SWARD

Chalk as a pigment and paint component. E. O. RASSER. *Kunststoffe* **18**, 177, 9, et seq. (1928).—In the literature only scattered examples of the usefulness of chalk for paint and pigment are found. The color tone of chalk inclines toward gray or yellow, owing to the presence of org. substances which cannot be removed by any means except by ignition and of a slight amt. of Fe oxide. The yellowish color due to iron oxide can be neutralized by the addn. of a suitable quantity of a blue pigment. Formulas are given for the prepn. of various paints. B. HAMILTON

Pigments from waste products. E. T. ELLIS. *Dyer, Calico Printer* **62**, 245, 9 (1929).—Suggestions are given for methods of prepg. the following substances from waste products: As_2S_3 , As_2S_5 , chrome red, chrome yellow, chromic arsenite, Cr_2O_3 , Cu arsenite, Emerald green (copper acetoarsenite), Fe_2O_3 , ferrous ferricyanide, manganic oxide, orpiment and Prussian blue. RUBY K. WERNER

Titanium dioxide and titanium white. C. P. VAN HOEK. *Farben-Ztg.* **34**, 2828-32 (1929).—The usefulness of Ti pigments in exterior paints is questioned because of the excessive chalking. TiO_2 itself should be used only in limited quantities as an ingredient of paints. 135 references are given. G. G. SWARD

Production of iron [oxide] colors. PETER P. BUDNIKOV. *Chem.-Ztg.* **52**, 846-7 (1928).—Magnetic oxide of Fe, produced as a by-product in the manuf. of aniline and α -naphthylamine, is a cheap raw material. After washing, heating for 1 hr. at 500-650°, and grinding, a brown-colored oxide is produced of poor covering power, but if the residues are treated with 40% of their weight of waste H_2SO_4 (70%) and heated for 2 hrs. at 750-800° the color and covering capacity are greatly improved. The higher the temp. of ignition the darker is the color. The stronger the acid used the tighter is the color. Mixts. with gypsum or heavy spar can be used as in the usual process for the production of Fe oxide colors. B. C. A.

Polymerization in the formation of linseed oil stand-oil. F. WILBORN AND F. KITTLER. *Farben-Ztg.* **34**, 2942-3 (1929).—The mol. wts. of stand oils were detd. by the Beckmann and the Rast methods and by a modified Rast method in which the m. p. of a mixt. of approx. 0.02 g. oil and 0.2 g. camphor in a 5 mm. closed tube was detd. While mol. wt. detns. were not considered capable of yielding complete information regarding the extent of polymerization, the last-named method was considered to be the most reliable. G. G. SWARD

Malayan lumbang oil. T. HEDLEY BARRY. *J. Soc. Chem. Ind.* **48**, 289-90T (1929).—The following consts. were found: sp. gr. 0.9264, I no. 150.8, sapon. no. 192.1, acid no. 0.66, unsapon. 0.41, n_D^{20} 1.4764. By adulterating China wood oil with lumbang oil and subjecting to the Brown heat test it was found possible to detect 10% or more of lumbang oil. In drying properties this oil compares favorably with linseed oil and is as good for paints on iron surfaces. On glass under lab. conditions this lumbang oil dried in 12 days as against 6 for linseed oil. A paint made up with Fe_2O_3 , china clay and

barytes when painted over a Pb primer on wood gave the same ratio of drying time as compared with a corresponding linseed oil paint, and the film was very soft after 3 weeks.

E. SCHERUBEL

Tung oil—particularly referring to the possibilities of production within the British Empire, with bibliography of the literature. L. A. JORDAN. *J. Soc. Chem. Ind.* **48**, 847-55(1929); cf. *C. A.* **23**, 4087.—Early in 1928 there was crushed 30,000 lb. of seed, mostly from the Florida plot. The best results were obtained with the Anderson expeller. Extn. processes were unsatisfactory. Tests of the product by consumers show it to be satisfactory. Since 1927 trial plots have been grown in Middle East Africa, India, Ceylon and New Zealand, some of which are promising.

E. M. SYMMES

Floor oils. WALTER OBST. *Allgem. Öl-Feltzg.* **24**, 699-700; *Chem. Zentr.* **1928**, I, 2227.—Mineral oil of d. 0.870-0.885 with 10% turpentine oil is most commonly used. To this mixt. may be added 5-8% of ceresin, stearin, or refined ozocerite. Hard drying oils are made by boiling wood oils with a Mn varnish with an equal quantity of either benzine or benzene. This material is particularly valuable for *calking*. A mixt. of linseed oil or wood oil is a valuable preserving agent for stone or cement floors.

C. R. FELLERS

Drying of dammar oil varnishes. C. KRAUZ AND V. KRACH. *Chem. News* **137**, 257 60(1928). Mixts. of equal parts of dammar resin and various oils (linseed, hempseed, locustseed, soy-bean, poppyseed and walnut) with varying amts. of driers were heated at definite temps. for varying lengths of time, and the varnishes so obtained were examd. for drying properties. The varnishes were the thinner the higher was the temp. at which they were prepd., while at the same temp. Co_2O_3 produced the thinnest and CoO the thickest products. The rate of drying increased with the temp. of heating up to a definite optimum, and again decreased as the temp. was raised further. The optimum temps. were situated between 175° and 275° , and the same drier usually required the same optimum temp. whatever oil was used. The I value of the original oil is only an approx. index of the rate of drying of the varnishes, locustseed-oil varnishes drying more quickly than linseed-oil varnishes. The acid and sapon. values decreased with rise of temp., duration of heating, and amt. of drier added. The optimum duration of heating was usually the shorter the higher the temp. used. The drier had a profound influence on the rate of drying. CoO was most efficient for oils of high I value, followed by MnO , Pb peroxide, red lead, Co_2O_3 , and PbO , but with oils of low I value PbO was best and CoO worst, while MnO was the best drier for poppy seed-oil varnishes and one of the worst for walnut oil. The optimum amt. of drier varied considerably, being usually the greater the higher was the optimum temp. The scraping test was applied to all varnish films, those prepd. at lower temps. being brittle while those prepd. at the optimum temps. were smooth and resistant.

B. C. A.

A method for the determination of the influence of water on varnish films. HANS KOPP. *Farben-Ztg.* **34**, 2892 3(1929).—Water or other liquid is placed in a Lind culture ring which has been cemented to the film with paraffin. An electrode (anode) is dipped into the liquid, the metal panel on which the film has been spread being the cathode. The cell is placed in series with a pencil lead, a moist starch iodide linen strip and a source of electricity. The starch iodide strip is caused to travel slowly below the pencil lead. When the film has become a conductor by imbibing the liquid a blue line is recorded on the strip. By means of a clock work and a relay the contact with the strip is made intermittently.

G. G. SWARD

Nature and constitution of shellac. II. Potentiometric titration in 95 per cent ethyl alcohol. WM. HOWLETT GARDNER AND WILLET F. WHITMORE. *Ind. Eng. Chem., Anal. Ed.* **1**, 205 81(1929); cf. *C. A.* **23**, 1762.—The analysis of various grades of shellac shows that in alc. soln. it acts like a weak org. acid and is slightly more acidic than other spirit sol. gums. Possibly the potentiometric titration may serve as a guide in such problems as the livering of paints.

W. T. H.

Boiling and evaporation rates of solvents and thinners for nitrocellulose lacquers. H. JORES. *Farben-Ztg.* **34**, 2886-92(1929).—Boiling ranges were detd. in an Engler app. Evapn. rates were detd. on 30 cc. liquid contained in a flat weighing glass 60 mm. diam. and 34 mm. deep. During weighing the glass was covered. Data on 65 solvents and mixts. are given. There is no definite relation between boiling ranges and evapn. rates.

G. G. SWARD

The constitution of artificial resins. JOHANNES SCHEIBER. *Chem.-Ztg.* **53**, 643 (1929); cf. Blumfeldt, *C. A.* **23**, 5179.—Polemical. HANS LEBACH. *Ibid.*—Polemical. A. E. BLUMFELDT. *Ibid.* 643.—Polemical.

W. C. EBAUGH

Light-rays and resinoids—a research problem. CHARLES W. RIVISE. *Plastics* **5**, 180, 211(1929).—The attempts of research workers to overcome the light sensitiveness

and the darkening of synthetic plastics are reviewed, also a no. of patents. The material may be given a finer color, greater tenacity and finer temper by subjecting it, after a prolonged mild heat treatment, to a higher temp. for a comparatively short time. For eliminating the orange or reddish color or tint often resulting from prolonged mild heat treatment, the heat treatment may be continued until the material is practically anhyd. and quite hard, followed by subjecting the block in a kiln to a temp. above 100° for several days. The addn. of 0.1% of the amt. of formaldehyde of hexamethylamine-tetramine in the soln. in the second stage of the process results in quick "setting." Concn. may be effected *in vacuo* and the hardening at atm. pressure, or at higher pressure, or at reduced pressure, or *in vacuo*. W. H. BOYNTON

Light and the resinoid plastics. CHARLES W. RIVISE. *Plastics* 5, 254-5, 266-8, 317-9(1929); cf. preceding abstr.—A résumé of what has been accomplished in the production of artificial resins resistant to light without material darkening. Brief analyses are given of certain patents relative to overcoming the main weaknesses of synthetic plastics. Several patents have been granted directed toward the utilization of photocondensation, photooxidation, photoresinification and photopolymerization in the decorating of metallic or other surfaces and the prepn. of screenless photolithographic plates and half-tone process plates and intaglio printing plates. W. H. BOYNTON

Action of zinc chloride on abietic acid. GEORGES ROTIN. *Bull. inst. pin* 1920, 251-2.—ZnCl₂ was found to act as a "cracking" catalyst toward rosin, yielding about 80% octahydrotetene, and probably also some higher hydrocarbons. The optimum proportion is 5%. It is almost impossible to operate *in vacuo*, because of excessive foaming. Best results were obtained by refluxing at atm. pressure for about 2 hrs., and then distg. at a pressure of 20 mm. A. PAPINEAU-COUTURE

Colored clays of the Olonetz region, U. S. S. R. (LILEEV) 8. Determination of organic peroxides [in oxidized linseed oil] (MARKS, MORRELL) 7. Pigment minerals of South Australia (JACK) 8. Particle size and the properties of matter [in manufacture of pigments] (NEVILLE) 2.

Preparing metal surfaces for painting, etc. CLARENCE F. DINLEY. U. S. 1,729,765, Oct. 1. Surfaces such as those of steel from which rust and oil, etc., are to be removed are sprayed with a compn. including rust solvent acid such as H₃PO₄, a liquid org. oil and grease remover such as alc., and finely divided inorg. solid absorbent material such as fuller's earth and kaolin, together with Fe phosphate, mixed in paste form; the paste is allowed to dry to form a friable coating on the surface, and is removed in dry condition. U. S. 1,729,766 relates to similar compns. contg. powdered absorptive amorphous C. U. S. 1,729,767 also relates to similar compns. for the same purpose. Cf. C. A. 22, 1659.

Pigment. WALTER O. SNELLING. U. S. 1,730,389, Oct. 8. Charcoal is dispersed in water in a colloid mill and the product is treated in a dye bath of complementary color such as a bluish aniline black to form a pigment which may be used as a substitute for usual "carbon black."

Venetian red. OCTAVE VAN CUYCK. U. S. 1,730,178, Oct. 1. A Venetian red compn. suitable for fusion at low temps. on paper or other decorated materials is formed from Fe oxide 10, glycerol 1, flowers of S 4, a resin 10 and niter 4 parts.

Liquid coating composition. GERALD H. MAINS (to Westinghouse Elec. & Mfg. Co.). U. S. 1,730,857, Oct. 8. A compn. suitable for use in making laminated insulating material comprises a condensation product resulting from the reaction of CH₂O, a drying oil such as China wood oil and a coal-tar acid contg. a substantial quantity of xyleneol.

Synthetic resin varnish. GUSTAVE E. LANDT and WM. H. ADAMS, JR. (to Continental-Diamond Fibre Co.). U. S. 1,731,071, Oct. 8. NH₃ and CH₂O are caused to react in an org. solvent such as alc. to form (CH₂)₆N₄ and the initial condensation product of a synthetic resin is dissolved in the soln. to form a potentially reactive varnish. U. S. 1,731,072 specifies dissolving the initial condensation product in an org. solvent such as alc. and then effecting reaction in this soln. between NH₃ and CH₂O.

27—FATS, FATTY OILS, WAXES AND SOAPS

E. SCHERUBEL

The applicabilities of wool fat. R. EHRENSTEIN. *Seifensieder-Ztg.* 56, 297-8 (1929). P. ESCHER

Saponification value of fats with special reference to barley fat. K. TAUFEL AND

M. RUSCH. *Z. Untersuch. Lebensm.* 57, 345-8(1929).—The sapon. value of barley fat increases with increasing time of sapon. and with increasing excess of alkali. Dilm. of the alc. alkali with xylene raises the b. p. of the mixt. but lowers the sapon. value by decreasing the concn. of alkali. The increase in sapon. value is due partly to rosin-like substances, which enter into side reactions, and partly to conversion of unsatd. acids into acids of lower mol. wt. The Reichert-Meissl and Polenske values also increase with increasing time of sapon. C. R. FELLERS

Detection of rancidity of fat from intact seeds and fruits. ANNELIESE NIET-HAMMER. *Z. Untersuch. Lebensm.* 57, 358-60(1929).—Storage affects the fat in seeds. The fat of fresh seeds and fruits gives no Kreis or Fellenberg reaction whereas these reactions are given by the fat of corn, sunflower, flax and other seeds stored for several years and incapable of germination. The disintegrated samples were successively extd. in a linen bag with acetone and CHCl_3 and washed with distd. H_2O and then extd. with petroleum spirit under a reflux condenser. The solvent is distd. from the ext. and the Kreis and Fellenberg tests are applied (C. A. 21, 506). C. R. FELLERS

Quantitative examination of the Kreis rancidity reaction. J. PRITZKER and R. JUNGKUNZ. *Z. Untersuch. Lebensm.* 57, 419-21(1929).—One drop (0.5 mg.) of a fresh aq. 1% soln. of acrolein is mixed with 3 drops of 3% H_2O_2 soln. in a stoppered cylinder, and after 3 hrs. in darkness 5 cc. of concd. HCl (sp. gr. 1.19) is added, and the mixt. shaken for 1 min. After the addn. of 5 cc. of a 1% soln. of phloroglucinol in ether a bright red color is obtained which reaches a max. after 5 min., and, if produced from 0.5 mg. of acrolein, may be matched in shade by 1.2 mg. of KMnO_4 in 100 cc. of water (or 3.8 cc. of 0.01 N soln.). In this version of the Kreis test the acrolein is completely oxidized by the H_2O_2 to epihydrinaldehyde, the sensitiveness of the test being 1:100,000, and the upper detectable limit 10 mg. of aldehyde in 100 cc. of oil. The method has been compared with that of von Fellenberg, and 10-yr. old samples of olive, soy and maize oils, arachis oil (2 yr.), lard (1 yr.) and butter fat (14 yr.) were found to contain 60, 60, 20, 100, 200 and 400 mg. of epihydrinaldehyde per 100 g., resp. Since, in the extreme case, the proportion of decomposed fat corresponds with about 13 times the amt. of aldehyde found, these samples were decomposed to the extent of 0.3 to 5%. C. R. FELLERS

The influence of sulfonation upon the constants of fatty acids. E. GANSEL. *Chem. Umschau Fette, Oele, Wachse Harze* 36, 284 6(1929).—G. treated 19 com. oils with 25% H_2SO_4 in one series and with 30% H_2SO_4 in another, taking care of complete sulfonation and also prevention of desulfonation. To recover the fatty acids, the SO_3 was removed by boiling with 10% HCl , the oils were sapond. and the fatty acids liberated with HCl . The acids had uniformly a different odor than the acids from the original oil; the titer was usually higher especially in those acids contg. unsatd. C bonds, the end point being sometimes indistinct; the I no. had decreased, again more in unsatd. than in satd. acids; the neutralization no. was also lower, in some cases enough to suggest formation of inner esters. The results are tabulated and may serve to det. what type of oil had been sulfonated. P. ESCHER

Fatty acids and glycerides of kusum oil. D. R. DHINGRA, T. P. HILDITCH and J. R. VICKERY. *J. Soc. Chem. Ind.* 48, 281-6T(1929).—Kusum fat from the seeds of *Schleichera trijuga* extd. by ether or CCl_4 contains complex unsaponifiable matter. The compn. of the mixed fatty acids is approx. oleic 60, linoleic 3 to 4, arachidic 20-25, palmitic 5-8, stearic 2-6 and myristic 1%. Arachidic is the main satd. acid present. Lauric acid is not present, contrary to statements of previous investigators. Acetic acid is present to the extent of 1-2% of the crude fat but probably not combined as a glyceride. The general structure of the glycerides appears to be that of other kernel fats, viz., a more or less even distribution of all the acids present among the glycerol mols. Kusum fat yields a soap hard and granular, but of fair lathering power. With oils it could be utilized for soap making. It is uncertain how far the properties of the various non-fatty compds. accompanying the oil would affect its suitability for edible purposes. E. S.

Studies with Twitchell's reagent. I. Influence of salts upon the emulsifying power of commercial fat-splitting agents. KYOSUKE NISHIZAWA. *Chem. Umschau Fette, Oele, Wachse Harze* 36, 277-84(1929).—The emulsifying power of 3 com. Twitchell reagents was measured at room temp. and at 95° in the presence of various substances by counting the drops when the reagent was dropped into purified olive oil from a Donnan pipet (*Z. physik. Chem.* 1899, 42). An addn. of 1% Twitchell reagent is sufficient to characterize its effect; more does not materially increase it. Acids increased the emulsifying power, the more the stronger the acid. The "Pfeilring" reagent was salted out considerably by strong acids; not so the "Idrapid" reagent, while the "Kontakt" reagent was the most sensitive; in all cases where no salting out occurred, the emulsifying power was increased. Addn. of salts of weak acids had little influence upon the emulsifying

power, but strong electrolytes, like NaCl, increased emulsification through increased ion concn. and through a change in the colloidal state; at certain concns. the Twitchell reagent was salted out, and then the emulsifying power decreased. The acidity of "Idrapid" was 241.6, cf "Pfeilring" 237.7 and of "Kontakt" 74.0. The emulsifying power of the Na salt of the reagent is considerable, but 1% of the reagent mixed with 1% of its Na salt has slightly less emulsifying power than 2% of the reagent alone. Addition of glycerol increased the emulsifying power in all cases, likewise the presence of fatty acids, the max. intensity of which is reached at 70% fatty acids. P. ESCHER

Committee on oils, fats and waxes. III. The functions of oils and fats in currying, fat-liquoring, oiling-off and chamoising. D. BURTON AND G. F. ROBERTSHAW. *J. Intern. Soc. Leather Trades Chem.* 13, 383-97(1929).—A survey of the literature. **IV. Iodine values.** V. KUBELKA, J. WAGNER AND S. ZURALEV. *Ibid* 437-42.—The Hanus, Rosenmund-Kuhnenn, and Margosches methods were compared for 6 oils and fats. Good agreement was obtained when the I no. < 100, but considerable variations occurred in the values obtained for a fish oil (125 to 139). The Hanus method is least affected by variations in size of sample, and the Hanus and Rosenmund methods are affected by variations in reaction time. **V. Oils and leather in 1929.** D. BURTON AND G. F. ROBERTSHAW. *Ibid* 522-33(1929).—A survey of the literature. H. B. M.

Results in regrading Lovibond red glasses. IRWIN G. PRIEST. *Oil & Fat Ind.* 6, No. 9, 27-9(1929).—Eight diagrams are given summarizing the results obtained in regrading 1000 red glasses. E. SCHERUBEL

Notes on oil analysis. STANLEY KETTLE. *Chemist-Analyst* 18, No. 5, 7(1929).—A rapid method for getting sapon. values consists in dissolving 5 g. of oil in 15 cc. of benzyl alc., adding phenolphthalein, titrating free acid, adding a measured vol. of KOH in benzyl alc. and titrating the excess after boiling 5 min. under a reflux condenser. Br values can be substituted for I values by dissolving the oil in CCl₄, adding KBr, a little KI and a known amt. of KBrO₃. After shaking, titrate the excess Br with NaHSO₃ soln. The Cl no. is characteristic and can be obtained by treating the sample with a satd. soln. of phenyl iodochloride in CCl₄, finally titrating the excess Cl with AgNO₃. For detg. acid values the substitution of a mixt. of 90% benzene and 10% alc. is better than alc. alone. A useful color test for mineral oils is obtained by short heating with concd. HNO₃. W. T. H.

The test of S. Fachini for the characterization of olive oils. R. MARCILLE. *Ann. chim. anal. chim. appl.* 11, 257-9(1929).—See C. A. 23, 3590. W. T. H.

Chia seed oil. WALTER F. BAUGHMAN AND GEORGE S. JAMIESON. *Oil & Fat Ind.* 6, No. 9, 15-7(1929).—The % compn of this oil is as follows: linolenin 41.1, linolin 47.2, olein 0.7, myristin, satd. acid glycerides + unsaponifiable 0.1, palmitin 5.1, stearin 2.9, arachidin 0.3, unsaponifiable 0.7. The drying power should be equal to or superior to that of linseed oil. The plant grows wild in Mexico. E. SCHERUBEL

The oil of Pistacia lentiscus. F. L. VODRET. *Ann. chim. appl.* 19, 76-84(1929).—This oil is abundant in Sardinia. It is used as a food. It is golden yellow, has aromatic odor and taste, d_{15}^{20} 0.9182, viscosity at 22° 10.65, η_{sp}/c = 1.467, optically inactive, f_D -6.0°, in Wood light shows yellow fluorescence, acid no. 28.05, sapon. no. 209.0, acetyl no. 21.09, acetyl no. after sapon. 228.6, I₂ no. 81.6. The approx. compn. is palmitic acid 24.82, stearic acid 11.63, oleic acid 47.62, linolic acid 6.25, glycerol 9.53, unsaponifiable (phosterol and resins) 0.96%. A. W. CONTIERI

Determining bleaching-loss coefficients. A. S. RICHARDSON, J. T. R. ANDREWS AND R. G. FOLZENLOGEN. *Oil & Fat Ind.* 6, No. 9, 19-20, 43(1929).—Detailed description is given of a lab. method for detg. oil retention by bleaching carths and carbons. The method involves detn. of the increase in wt. resulting when a sample of the bleaching material is treated with oil and the excess oil removed by suction in a stream of hot inert gas under standardized conditions. The oil retention values obtained fall within the range of those observed under practical conditions of plant operation. E. S.

Test for neutral oil in soap or fatty acids. JOHN E. RUTZLER, JR. *Oil & Fat Ind.* 6, No. 9, 23-4, 29(1929).—The test is based on that of Lewkowitsch for unsapond. fat, which specifies that by dissolving 3 cc. of fatty acids in 15 cc. of 95% alc. and adding 15 cc. of NH₄OH a turbidity will appear if unsapond. fat is present. Use is made of an *emulsometer*, consisting of a 100 w. elec. light shielded by a round container with a pin hole in the top and from which a small diam. pipe extends upward. On the top of the pipe a Nessler tube is supported at a distance of 93.2 cm. from the light. The emulsion is poured into the Nessler tube until the light cannot be seen, when the height of the emulsion in the tube is read. The test has been reduced to a quant. basis and the Nessler readings were plotted as ordinates and the % neutral oil as abscissas; and from the Nessler reading by reference to the curve, the % neutral oil can be read directly. E. S.

Soap base and its complete saponification. J. DAVIDSOHN. *Seifensieder-Ztg.* 56, 293-4, 303-5(1929).—The Am. practice of adding coconut oil to the sapon. tallow and continuing sapon. to the end furnishes a soap base of better keeping quality (only 0.1% unsapon. fat is left in the soap) than the German practice of sapon. each oil separately and then mixing the 2 soaps. D.'s method of prepg. cold-made soaps (C. A. 21, 2392) and also the method of sapon. in an autoclave likewise lead to completely sapon. soap bases contg. less than 0.1% unsaponifiable. Soaps with much less than 0.1% may revert, liberating free acids and causing rancidity or brown spots. P. ESCHER

The mean and variability as affected by continuous selection for composition in cotton (WINTER) 11D. The structural viscosity of water solutions of sulfonated oils (SCHINDLER, FLASCHNER) 2. Filter for oil (U. S. pat. 1,730,581) 1.

Extracting fatty acids, resins, bitter substances and mucilage from oils and fats. KARL F. WILHELM. U. S. 1,729,809, Oct. 1. An animal or vegetable oil or fat to be purified is treated with a solvent such as benzine or C_2HCl_3 and the mixt. is subjected to the action of an aq. alc. NH_3 soln.; the product thus formed is further mixed (preferably while warm) with about 1% of Glauber's salt previously dissolved in 10 times its quantity of aq. alc. NH_3 soln.; the products form into layers on standing and are sepd.

Soap for use on the skin. NIELS B. JANSSEN. U. S. 1,730,428, Oct. 8. Soap is produced from a mixt. of tallow 20, lye 10 and celery trimmings 5 parts.

28—SUGAR, STARCH AND GUMS

J. K. DALE

A German sugar factory in the fifteenth century. E. O. V. LIPPMAN. *Centr. Zuckerind.* 37, 872-4(1929). J. F. LEBTE

Sugar technology. W. L. McCLEERY. *Proc. Hawaiian Sugar Planters' Assoc.*, 48th Ann. Meeting 1928, 323-30(1929); cf. C. A. 22, 3796. —Satisfactory operation of the Oliver filter on a com. scale was obtained by increasing the suspended solid matter content of the settled cane juice to 27%. Difficulties were encountered with juices contg. lower percentages of suspended solids. Better performance was also obtained by increasing the spacing of the wires supporting the filter cloth to 2 in. The resistance of metals to corrosion under sugar-factory conditions was in the following order; Delhistandard Fe, Agathan Enduro, Resistal 2600, Alleghany Metal, Tobin bronze, brass, com. bronze, Keystone steel, blue annealed steel, Cu-bearing steel and Toncan. Data are given on the purity-viscosity relations at different densities in molasses from various Hawaiian factories. Expts. on the relation between the dye test for colloids and the filtration rate of raw-sugar solns. showed that the material retarding filtration is of larger than colloidal dimensions. There were indications, however, that a high colloid content is usually associated with a high concn. of the less finely dispersed material that does retard filtration. The thermal value of dry bagasse produced by the Honolulu Plantation Co. varied from 8037 to 8363 B. t. u. per lb. K. D. JACOB

Report of raw-sugar technical committee. W. R. McALLEP. *Proc. Hawaiian Sugar Planters' Assoc.*, 48th Ann. Meeting 1928, 241-7(1929); cf. C. A. 22, 3797. —No correlation was found between the occurrence of hard sugar and the colloid content as detd. by cataphoresis measurements. At relative humidities between 60 and 70%, the moisture in raw sugar comes to an equil. at a point where the sugar is free-running and still has a safe deterioration factor. Within this range hard sugar takes up moisture and softens, while damp sugar dries out, but not to the point where it becomes hard. Upon emptying a warehouse at the end of the season a smaller proportion of sour sugar was found than at the time the sugar was placed in storage. This appeared to be due to the low relative humidity in the warehouse, the sugar drying out until deterioration stopped and the sour-smelling products of deterioration volatilizing. The so-called "dye values" were not reliable indications of the filtration characteristics of raw sugars. Filtration with kieselsol reduced the dye values less than 20%. K. D. JACOB

Denatured raw sugar as fodder. EGON KRAUS. *Z. Zuckerind. czechoslovak. Rep.* 53, 510-2(1929).—See C. A. 23, 4512. J. F. LEBTE

Use of Super-Cel in the sugar-refining industry. ARTHUR ELSENBAST, R. D. ELLIOTT AND E. J. SULLIVAN. *Ind. Eng. Chem.* 21, 676-84(1929).—Super-Cel is the trade name of a patented processed diatomaceous silica. In various sugar-refining

processes, it is decidedly economical to filter the liquors at various stages and reasons for the filtrations specified are outlined. Several flow sheets are shown. W. H. B.

Computations of the yield of sugar. JOSEF HAMOUS. *Listy Cukrovar.* 47, 743-4 (1929).—A series of computations from 4 different refineries. FRANK MARRESH

Studies of sugar-factory filter cloths. III. The changes in the mechanical and physicochemical properties of filter cloths through use. K. ŠANDERA. *Z. Zuckerind. czechoslov. Rep.* 53, 485-92(1929); cf. *C. A.* 23, 2512. J. F. LEETE

Use and control of steam in the sugar industry. J. R. GOODNER. *Power Plant Eng.* 33, 1101-2(1929).—It is important that sugar—possibly from the condensate—be watched for. If present it is apt to decompose, forming acids. The p_H in the boilers is usually kept above 8.0. D. K. FRENCH

The beginnings of the beet-sugar industry in the free state of Saxony. K. ULRICH. *Deut. Zuckerind.* 54, 577-85(1929). J. F. LEETE

Observations on the valuation of sugar beets according to quality. R. E. GROTKASS. *Deut. Zuckerind.* 54, 572-4(1929).—G. points out the unfairness of valuing beets according to weight only. J. F. LEETE

Sugar beets for factory purposes. FRANK T. SHUTT. Canada Dept. Agr., *Rept. Dominion Chemist, Year Ending March 31, 1928*, 34-44(1929).—Tables are given showing the percentage of sugar in juice, coeff. of purity, av. wt. per root and yield per acre of 18 varieties of sugar beets grown in several Canadian provinces. K. D. JACOB

The sugar-beets of Sicily. F. SORGÈS. *Chim. ind. agricolt. biol.* 5, 149-52(1929).—Four varieties of sugar-beets from Sicily, viz. (a) *Blanche française riche*, (b) *Blanche améliorée A*, (c) *Blanche améliorée B*, (d) *Klein Wanzleben*, were examined. The analysis of a, b, c and d gave the following results, resp.: av. wt. kg. 1.098, 1.190, 1.117, 1.258, dry matter 15.4, 18.9, 17.0, 16.9%, sugar 10.55, 14.0, 12.1, 11.9%; ash 1.5, 0.92, 0.86, 0.90%; sucrose in the juice 10.79, 14.85, 12.46, 12.05; Brix 16.3, 18.8, 17.2, 16.6; purity 66.2, 79.0, 72.4, 72.6. G. A. BRAVO

A note on the sampling of sugar beet. S. T. JOHNSON. *J. Agr. Sci.* 19, 311-4 (1929).—Samples of 10 beets do not give even an approx. indication of the true sugar % of a large no. of beets. Increasing the sample to 50 gave a precision that could be considered satisfactory for com. purposes. For exptl. work, however, even 50 beets are inadequate. P. R. DAWSON

The De-Vecchis process for extraction of sugar from beets. IVO GIORDANO. *Giorn. chim. ind. applicata* 11, 155-63(1929). A description of the plant and process developed by De-Vecchis for extrn. of beet sugar. Its feature is that the beets, after washing and slicing, are desiccated, so that subsequent extrn. with hot water gives at once very concd. solns. (about 50° Brix). A. W. CONTIERI

A description of the Scott dryer [for sugar beets] in Sanguinetto, Italy. W. GRAZIANSKY. *Deut. Zuckerind.* 54, 703-4(1929). J. F. LEETE

The composition of the [sugar beet] juices in the 1928-9 season. J. VONDRAK AND B. ZIMMERMAN. *Z. Zuckerind. czechoslov. Rep.* 53, 513-9(1929).—See *C. A.* 23, 3121-2. J. F. LEETE

The purification of raw [beet sugar] liquor. E. TROJE. *Deut. Zuckerind.* 54, 558-66(1929).—A discussion with many references. J. F. LEETE

Experiments in the evaporation of [beet sugar] liquors in the presence of activated carbon. VL. STANĚK AND P. PAVLAS. *Z. Zuckerind. czechoslov. Rep.* 53, 494-9 (1929).—See *C. A.* 23, 3122. J. F. LEETE

A simple apparatus for the determination of color in [beet sugar] juices. A. H. ERDENBRECHER. *Deut. Zuckerind.* 54, 749-51, 825(1929). A color standard is prepared by autoclaving alk. molasses (patent applied for) and used in a special colorimeter to "titrate" distd. water to the color of the liquor. J. F. LEETE

The effects of sugar-beet diseases on the color of the liquors. H. ROESNER. *Centr. Zuckerind.* 37, 802-3(1929).—Exptl. data are given. J. F. LEETE

International society of sugar-cane technologists. Special committee on uniformity in reporting factory data. Fourth communication. M. A. DEL VALLE, E. C. VON PRITZELWITZ VAN DER HORST AND F. W. ZERBAN. *Planter* 83, 141-3(1929).—This report gives: (1) General definitions of sugar house terms and (2) terms and definitions for the milling plant including wt. of bagasse, juice figures, imbibition and diln. figures, cane figures and figures used for judging mill results. J. F. BREWSTER

The effect of diseased cane on the Java ratio. HILARION G. HENARES AND CATALINO G. AURELIO. *Sugar News* 10, 328-33(1929).—The crusher juice from the diseased cane gives high polarization and purity, but since the center of the cane hardly contains any sucrose, because of the effect of the disease, the Java ratio becomes low. V. G. L.

Deterioration in P. O. J. canes. G. B. SARTORIS. *Sugar* 31, 144-6, 196-7 (1929).—Comparative analytical data are given showing changes in sucrose content, purity and acidity of cane varieties P. O. J. 36, 213, 234 and 826 in Louisiana when left standing or when windrowed in winter. In warm weather spontaneous inversion in cut cane is rapid, but very slow after a frost. It is considered better to let cane stand in the field until it can be cut for the mill rather than to windrow it.

J. F. BREWSTER

Laboratory control of processes. RUDOLF FREUND. *Listy Cukrovar.* 47, 721-6 (1929).—F. reviews all of the possible methods which labs. can use in controlling the process by which sugar is made. A complete bibliography is given.

FRANK MARESH

Laboratory studies of the effect of carbon monoxide and other components of saturation gas (CO₂) on the rate and course of the saturation. R. SIGMUND. *Z. Zuckerind. czechoslovak. Rep.* 53, 473-9 (1929).—See *C. A.* 23, 2317.

J. F. LEEBE

Experiments in the saturation of thin liquors. L. KAYSER AND P. WENDELER. *Deut. Zuckerind.* 54, 553-6 (1929).—The curves show that treatment with SO₂ alone produces a marked decolorization only from p_H 8 to 7, the optimal lime removal lying in this region also. Treatment was carried out with SO₂ (1), CaO (2) and CO₂ (3) in the orders 3, 2, 3; 1, 2, 1; 1, 2, 3. The CO₂ treatment was always carried to optimal alky. CaO was 0.2 or 0.07%, SO₂ to p_H 7 or less. The results all show that the lime removal varies with the residual alkalinity. The best lime removal as well as that the highest purity of liquor is attained by the CO₂, CaO (0.2%), CO₂ treatment, but the decolorization is only 10%. These methods will be tested in the refinery.

J. F. LEEBE

Determining the sugar content of saturation sediments. J. KADLEC. *Listy cukrovar.* 47, 735-6 (1929).—Samples of sediment from about 30 places in the sediment presses were collected before the sugar soln. was expressed; the samples were mixed together and analyzed for sugar by the Zn(NO₃)₂ method. The expressed juice was analyzed by polarization. The sediment contained 11.13% sugar; the expressed juices 25.5%, and the expressed sediment 1.4%. No explanation is given for this anomaly. For HERLES. *Ibid* 748—A criticism of the work of Kadlec. JOSEF HAMOUS. *Ibid* 748-9—A discussion of all possible errors in the analytical procedure of the above analysis by Kadlec.

FRANK MARESH

The distribution of sampling vessels for raw juices and molasses. FERDINAND KAYZ. *Listy Cukrovar.* 48, 14-5 (1929).—A modification in design is described.

FRANK MARESH

Centrifugal clarification. R. H. HURST. *Trop. Agr. (Trinidad)* 6, 112-3 (1929).—Expts. were conducted on clarifying sirup and molasses by centrifuging at 3000 and 2,000 r. p. m. Centrifuging reduced the viscosity of the samples. Pectins are easily removed by centrifuging but pentosans are not. Pectins are therefore thought to be less highly hydrated in soln. The sludge removed by centrifuging contained about 50% ash. The results indicate that centrifuges may be successfully used for sugar clarification on a factory scale.

A. L. MEHRING

An efficient sugar-concentration apparatus. C. W. EDDY AND PAUL SCHILDNECK. *Chemist Analyst* 18, No. 5, 15 (1929).—By means of an adapter tube, such as is used with condensers, and glass tubing, a simple vacuum separatory app. can be constructed which is useful for removing liquid from a strongly foaming soln. such as obtained in the extn. of certain aldehyde sugars by vacuum distn.

W. T. H.

A steam balance in evaporation and vacuum pans. JOS. HAMOUS. *Listy Cukrovar.* 48, 7-8 (1929).—A series of computations is given.

FRANK MARESH

Extraction of last liquors. JIRÍ DIEHN. *Listy Cukrovar.* 47, 749 (1929).—An ext. having a sp. gr. below 1.08 and 48° of hardness was evapd. on a H₂O bath yielding a brown liquid (sp. gr. 1.75) with an invert-sugar content 1.10 per 100 g. of dry matter and a purity of 94.0. An ext. of the same batch was passed through a H₂O softener and showed 6° of hardness. This soln. was concd. to a sp. gr. = 1.63; it had a pale yellow color, a purity of 96.0 and 0.36 parts of invert sugar per 100 parts of dry matter. Further studies are promised.

FRANK MARESH

Weights per U. S. gallon and weights per cubic foot of sugar solutions. C. F. SNADPR AND L. D. HAMMOND. *Planter* 82, 501-2 (1929).—Four tables are computed for use in sugar work. Table 1 gives wts. per U. S. gal. and wts. per cu. ft. of sugar (sucrose) solns. at 20°. Table 2 gives wts. per U. S. gal. of sugar (sucrose) solns. at different temps. Table 3 gives wt. in air of a 70% soln. of sucrose at 20° at different barometric pressures. Table 4 gives a condensed table comparing the table at 17.5° of Spencer's Handbook with Table 1.

J. F. BREWSTER

The reducing power of sucrose. G. BRUNNS. *Centr. Zuckerind.* 37, 852-4, 874-5 (1929). A review with references. Ten g. sucrose is equiv. to 28.16 (av.) mg. Cu. B. points out the likelihood of Na saccharate formation.

J. F. LEEBE

Color perception of workers in sugar or chemical laboratories. R. H. KING AND G. A. GUANZON. *Planter* 83, 222-3(1929).—Students were differentiated into 2 groups: (a) Color-blind, those who could not match colors or observe color changes and (b) color-ignorant, those unable to sep. colored strips according to designated terms. It was shown that about 3% of the workers in routine work are color-blind and about 10% of individuals may be expected to be color-blind or color-ignorant. The results given will aid in detg. the accuracy of individual workers and will provide a simple method of evaluating workers assigned to colorimetric work. J. F. BREWSTER

The diffusion of non-sugars. VL. STANEK AND J. VONDRÁK. *Listy Cukrovar.* 47, 745-8(1929).—Four solns. were used: (1) a 0.1% NaCl, (2) a 0.1% urea, (3) a mixt. 0.5 NaCl and 0.5% urea, (4) 0.5% urea for studying the reaction rate. The quantity of non-sugars which diffused from the solns. into the diffusion liquor was (1) 39%, (2) 27%, (3) 26%, resp. In the 4th soln. a rapid withdrawal and a slow operation caused a transfer of 26% of the urea; a rapid operation caused a transfer of 30% of the urea. A slow rate of withdrawal yielded a better liquor; only 19% of the urea diffusing over. A rule is formulated: withdraw the liquor as slowly as possible without causing infection when using contaminated or hard water. The impurities in water penetrate into the cells of the beets and thus effect a cleansing action of the diffusion liquor. An alk. water contg. 0.1% carbonaceous ash would diffuse approx. 0.03% ash into the diffusion liquor and increase the ash of the liquor 0.025 ± 0.005 %. Since 1 part of ash retards 5 parts of sugar from crystallizing and gives origin to 10 parts of molasses, the probable increase in molasses will be 0.25%. The org. non-sugars in a 0.1% concn. would diffuse to form a 0.03% concn. in the diffusion liquor; the increase in molasses due to the org. non-sugars would be 0.125%. Even though many of these products may be removed in satn., the losses in quality and quantity are large. FRANK MARESH

Experiments in the rapid cooling of low-grade massecuites. ARNOLD H. WARREN. *Sugar News* 10, 317-23(1929).—W. shows (1) that a low-grade massecuite can be cooled rapidly without formation of false grain; (2) that molasses of below 33 apparent purity can be obtained within 10-12 hrs. after the cooling is begun and (3) that any low-grade massecuite purges much more rapidly when hot than when cold. V. G. LAVA

Old and new methods of treating sugar-factory waste waters. J. JASKÓLSKI. *Z. Zuckerind. czechoslovak. Rep.* 53, 503-10, 519-24(1929). A discussion. J. F. LEETE

The treatment of waste waters from sugar-refineries. JOSEF JASKÓLSKI. *Listy Cukrovar.* 48, 1-7, 9-14(1929).—(I) Several processes are reviewed. (II) Cl was passed into an absorption tower into which the waste water was sprayed. The Cl functioned as a sterilizing and deodorizing agent. The presence of Cl in the return H₂O aids in sedimentation; an absence of humin material and 55% of the usual lime addn. gave good sedimentations. This is due to the fact that the Cl prevents fermentation, during fermentation, protective colloids form and prevent a flocculation and sedimentation of org. matter. The optimum results were given when the p_H exceeded 9. FRANK MARESH

The adsorption properties of active, ash-free char preparations. ERHARD LANDT AND K. K. BHARGAVA. *Z. Ver. deut. Zuckerind.* 79, 470-84(1929). Inactive sugar chars activated in various ways (preferably by air at 550-1050°), show an iodine-adsorption power comparable to that of commercial chars. Their behavior toward HCl and NaOH varies considerably with the method of prepn. With fatty acids they behave more uniformly, the amt. of the acid adsorbed increasing directly with the number of C atoms in the acid. These chars are of little value in removing the coloring matter of molasses, the dimensions of the pores being too small. The lower the temp. employed and the smaller the amt. of air used for activation, the higher is the adsorptive power of the char for NaOH. The greater the alkali-adsorptive power of the sugar char, the smaller is the increase in adsorbability for fatty acids as the fatty acid series is ascended. A review of the literature is given and the results are discussed. F. CAMPS-CAMPINS

The character of active carbons. P. TERECHOV AND J. DĚDEK. *Sugar* 30, 349-50, 395-6, 443-4(1928).—I. Cataphoresis expts. with 2 carbons, A, a low temperature C, and B, a high temperature C, suspended in 60% sugar solns. Both kinds of particles move to the anode, A more rapidly than B. II. Sedimentation expts. Both types are more stable in alk. solns. A settles more quickly in acid soln. and B more quickly in pure H₂O. III. Conductivity measurements upon suspensions of the carbons in H₂O and in solns. of electrolytes are given. J. F. BREWSTER

Studies on tapioca. III. Further notes on the determination of phosphoric acid in tapioca material by the ceruleo-molybdate method. V. R. GREENSTREET. *Malayan Agr. J.* 17, 210-2(1929); cf. C. A. 22, 3602.—A comparison of phosphoric acid detns. by the ceruleo-molybdate and molybdate-magnesia methods. There is no relationship

between the acidity of the solns. examd. and the error in the detn. of phosphoric acid. Out of 33 samples, in 13 instances the colorimetric result was lower than the gravimetric, in 12 instances it was higher, while in 8 instances the results were identical. In only 8 instances did the discrepancy amount to more than 10%.
E. F. SNYDER

Megass. Its value as a material for the manufacture of paper and of artificial silk (ANON.) 23. Report on agriculture (VERRET, MANGELSDORF) 15. Factors influencing the growth and sugar content of cane (RAO) 11D. What quantity of fertilizer to use (LOCSIN) 15. H_2PO_4 gives big increased yields in uplands of La Carlota district (ANON.) 15. Recovering sucrose from cane molasses. HOLGER DE F. OLIVARIUS (to Calif. Packing Corp.). U. S. 1,730,473, Oct. 8. The molasses is fermented to eliminate invert sugar, the fermented molasses is mixed with alc., an earthy metal oxide or hydroxide is added to the soln. to ppt. interfering org. and coloring matter without materially pptg. the sucrose, the ppt. is sepd. and the alc. is sepd. from the remaining soln. and the latter is then treated with an earthy mineral oxide or hydroxide to ppt. the sucrose.

29—LEATHER AND GLUE

ALLEN ROGERS

Report of the Committee of the International Society of Leather Trades Chemists on Tannin Analysis. J. GORDON PARKER, *et al.* *J. Intern. Soc. Leather Trades Chem.* 13, 112 21(1929). Comparative analyses of different tanning materials indicate that the Procter extractor gives results for sol. matter practically identical with those yielded by the Koch extractor. The use of 2000 ml. H_2O and an extn. period of 4 hrs. is advised. The official restoration of the Procter app. is advocated on account of its simplicity and ease of operation. Comparative detns. of H_2O by the direct and by the indirect methods, using vacuum oven, elec. oven, H_2O oven and "combined evaporator-drier," resulted in higher figures by the direct method, no matter which form of drying app. was used. It is advised that the direct method for H_2O be made compulsory for all solid exts. Comparison of results obtained for sol. matter using (1) the filter candle, (2) 5 different papers and 2 different kaolins, (3) Turnbull's method, (4) McCandlish-Atkin method, (5) centrifuge and (6) sedimentation showed that (2) gives slightly lower results than (1); (1), (3) and (4) give practically identical results; (5) and (6) give decidedly higher results than (1). By increasing the pretannage of the paper, the results obtained by (2) approach those obtained by (1). (1), (2), (3) and (4) give equally concordant results in the hands of different analysts. The filter candle method is preferred as being quicker and simpler than the so-called contact method. The official method of chroming hide powder is considered preferable to the former method. H. B. MERRILL

The modified agitation method for tannin analysis and the Darmstadt apparatus. G. BALDRACCO. *J. Intern. Soc. Leather Trade Chem.* 13, 365-75(1929); cf. *C. A.* 19, 3170, 23, 1768, 3592.—The method is the most practical, rapid and rigorously scientific of all methods yet known, and is at least as exact as the official method. H. B. M.

Tannin content of dead chestnut trees. R. M. NELSON and G. F. GRAVATT. *J. Am. Leather Chem. Assoc.* 24, 479-499(1929).—Chestnut trees dead up to 30 yrs. contained as much tannin as av. living trees. Decayed wood contained practically as much tannin as sound. The bark and heartwood of chestnut contained 7-12% tannin (A. L. C. A. method), and the sapwood 2-4%. H. B. MERRILL

Tanniferous barks of Madagascar. IV. "Sakoa" bark (*Sclerocarya caffra* Sond). A. DEFORGE, J. MAHEU and F. HEIM DE BALSAC. *Halle aux Cuirs* 1929, 238-41; cf. *C. A.* 23, 4366.—The tannin content (about 3.5%) is too low to warrant exploitation. "Lalona" bark (*Weinmannia* Sp.) *Ibid* 278 86.—Analysis showed H_2O 11.3, sol. tannin 13.7, sol. non-tannin 2.7, insol. matter 72.3%. Catechol tannin predominates. Leather tanned with sakao is satisfactory except for the color, which is too yellow. The bark has local possibilities, but is hardly valuable enough for exportation. H. B. MERRILL

Improved tannage for book-binding leather. J. R. LORENZ. *Hide & Leather* 78, No. 2, 23-5(1929).—Leather tanned first with chestnut and dividivi, followed by sulfited quebracho, is claimed to equal that produced by the customary sumac tannage.

Purification of tannery effluents by colloidal clay. J. BESSE. *J. Intern. Soc. Leather Trades Chem.* 13, 503-7(1929); cf. following abstr.—By acidifying with H_2SO_4 and treating with a suspension of clay, practically all impurities are pptd., and the effluent is rendered clear, free from sulfide, low in N and non-foaming. H. B. M.

The purification of tannery effluents by means of argillaceous colloids. J. BESSE. *Cuir tech.* 18, 244-6(1929); cf. preceding abstr.—Lime liquors were made slightly acid to phenolphthalein and an equal vol of 2% brick clay suspension, prep'd. by agitating clay in 0.05% Na_2CO_3 , was added. Analyses of 4 lime liquors showed that in all cases the total N, sulfides, and solids of the solns. after flocculation were 10% or less of the original concentrations. The great disadvantage is the large vol. of H_2O necessary. *Ibid* 294-7.—A review of the colloidal properties of clays.

The unhairing and tanning of sheepskins. ALBERT J. HANGLIN. *Cuir tech.* 18, 324-5(1929).—A description of American methods. J. G. NIEDERCORN

Tanning of sheepskins with the wool. O. DUJARDIN. *Leather Manufacturer* 40, 123-4(1929).—Descriptive. H. B. MERRILL

The question of lactic acid bacteria in tanning liquors. R. W. SCHWARTZBERG AND P. M. GINDIS. *Zentr. Bakt. Parasitenk., Abt. 2*, 78, 96-105(1929). J. T. M.

Sulfur dioxide in tanning. SHAPERO AND LESZINSKII. *Vestnik Koshevennoi Prom. i Torgovli* 1927, 283.—Soaking in 1% SO_2 soln. gives favorable results. Deliming with SO_2 is cheaper than with ordinary mineral acids and gives better results. The following formula is recommended for sulfiting or ordinary quebracho. Per 100 kg of quebracho, 1 kg. of SO_2 is used and 2.4 kg. soda ash or 2 kg. of NaOH. The quebracho is heated with water, the SO_2 is introduced from a cylinder and the soln. is neutralized for reduction of $\text{Na}_2\text{Cr}_2\text{O}_7$ in the prepn. of 1-bath and also of 2-bath chrome liquors. The use of SO_2 in the prepn. of chrome tanning liquors is advantageous because of the elimination of Fe and of the excess of Na_2SO_4 , which is not always a desirable ingredient for tanning liquors. B. MONSAROFF

Useful notes on chrome tanning. LIBOSLAW MASNER. *Cuir tech.* 18, 203-4(1929).—Methods of liming and tanning calf-skins and sides are described. J. G. N.

The preparation of chrome tanning liquors. B. KÖHLER. *Gerber* 55, 167-8(1929).—The use of $\text{Na}_2\text{S}_2\text{O}_4$ in the reduction of $\text{K}_2\text{Cr}_2\text{O}_7$ in the presence of Cr alum is to be preferred to the use of $\text{Na}_2\text{S}_2\text{O}_3$ and Cr alum only, because long boiling is unnecessary and the colloidal S is left in the most desirable condition. For the prepn. of the equiv. of 100 parts by wt. of Cr alum, the following formula has been developed: $100-0.75B$ wt. of Cr alum; $0.2206B$ = wt. of $\text{K}_2\text{Cr}_2\text{O}_7$ and $0.5586B$ = wt. of $\text{Na}_2\text{S}_2\text{O}_4$, where B is the basicity (Schorlemmer). J. G. NIEDERCORN

Waste products of the saccharin industry used in synthesizing tanning agents and in tanning. WALTHER HERZOG. *Metallbörse* 19, 1853-4(1929).—The utilization of *p*-toluenesulfonyl chloride, and *p*-toluenesulfonic acid in the tanning industry is shown chiefly from patent references quoted. Chrome leather spew and its qualitative analysis. G. GRASSER. *Cuir tech.* 18, 204-5(1929); cf. C. A. 23, 3594.—A brief review of previous work with references is given. For analysis spewed areas are scraped with a spatula and a sample so collected is burned upon a loop of Pt wire in a Bunsen flame. The odor of acrolein and a bright flame indicate fatty acids; the odor of SO_2 and a blue flame indicate S. If fusion takes place and an ash remains, a salt is present and tests for Ba, Al, Na, K, Ca, Cl and SO_4 are made. The spew may be extd. with petroleic ether and a drop of the ext. placed on sized paper; a visible grease spot results if fatty acids are present. The spew may also be warmed with a few drops of 20% NaOH soln. and then Na nitroprusside soln. added; a violet coloration indicates the presence of S. J. G. NIEDERCORN

The natural fats of goat skins and their relation to the formation of fatty spews in chrome leather. R. FARADAY INNES. *J. Intern. Soc. Leather Trades Chem.* 13, 375-82(1929).—In many skins showing fatty spew, the spew is assocd. with a purple compd. of

Cr and fatty acid, sol. in petr. ether. The white spew consists mainly of fatty acids having a m. p. of about 50–51°. On treatment of oleic acid with basic 1-bath Cr-liquor, a purple ppt. is formed that is sol. in petr. ether and contains 2.9–3.6% Cr. A similar compd. is formed by treating Ca oleate with Cr liquor, but is not formed with stearate or palmitate or the free acids. The glycerides give no such compd. The important factor predisposing the finished leather to the formation of spew is the presence of free fatty acids in the fat. These may arise through improper curing or storage conditions, producing rancidity. Variable amts. of lipase were demonstrated in cured goat skin as it reaches the tanner. Pancreatic enzymes used in bating apparently do not exert an appreciable hydrolytic action on the skin fat. The purple spew was produced experimentally by impregnating skins with oleic acid before Cr tannage, and the white spew was produced by introducing stearic and palmitic acids.

Vegetable-tanned sole leathers. A. COLIN-RUSS. *J. Intern. Soc. Leather Trades Chem.* 13, 443–62(1929); cf. C. A. 22, 329.—From analyses of numerous leathers it is deduced that the following relationship exists between quality and (1) % collagen and (2) ratio collagen: H_2O -sol. matter: Grade I: collagen > 42%, (H_2O -sol. collagen) < 0.4; Grade II: collagen = 42–32%, (H_2O -sol. collagen) = 0.4–0.9; Grade III: collagen < 32%, (H_2O -sol. collagen) > 0.9. In general, % fat, H_2O , ash and degree of tannage increase from Grade I to III, while % (collagen + fixed tannin) decreases from Grade I to III. No progression was noted in (free tannin/ H_2O -sol. matter). Liability to spew is a function of structure rather than compn. The grade may readily be deduced for microstructure (illustrated).

Studies on the hydrogen-ion concentration by coagulating latex of Hevea brasiliensis. I. Sodium fluosilicate as coagulating agent. L. R. VAN DILLEN. *Arch. Rubber-cultuur* 13, 448-64(1929). (In briefer form in English 465 72.)—The beginning of a study of the p_H concn at which latex coagulates, the present paper deals with the theory of the quinhydrone electrode and the system used in the exptl work undertaken. The assumption of van Harpen regarding the splitting of Na_2SiF_6 is discussed critically and is considered to be erroneous. An alternate theory is offered in its place. Na_2SiF_6 soln. acts as a buffer, the components being 1 part of NaF and 2 parts of HF. The p_H values of the Na_2SiF_6 solns. are higher than the theoretical values of the corresponding buffer mixts., but NaF and HF in Na_2SiF_6 solns. are available in very low concns. By dilg. a buffer consisting of 1 equiv. of NaF and 2 equivs. of HF, the p_H value is the same as in Na_2SiF_6 soln. By dilg. a Na_2SiF_6 soln. the p_H value diminishes at first and subsequently increases gradually. This may be explained on the assumption that the degree of hydrolysis increases more rapidly than the degree of diln. At the lowest p_H value the remaining fluosilicate is entirely split up, after which by carrying on to a greater diln. the concn. of NaF and of HF diminish, and this involves a gradual increase of the p_H . Tests with very weak mixts. of latex and Na_2SiF_6 solns. showed that in this way the p_H values diminished greatly, chiefly as a result of the remaining fluosilicate splitting up entirely though there are probably other phenomena contributing to this result. Moreover, by dilg. with water samples of latex of different origins, great differences in the p_H range were found, because of the fact that the water samples were buffered in a different way. Measurements of the p_H values in buffers consisting of NaF and HF proved the assumption that in Na_2SiF_6 solns. 1 mol. of Na_2SiF_6 yields 1 mol. of NaF and 2 mols. of HF.

Transformation of energy by rubber. IRA WILLIAMS. *Ind. Eng. Chem.* 21, 872-6 (1929).—The exptl. data indicate that elasticity is a property which persists through vulcanization and is not created by the latter process. The phys. state of the rubber after any cure depends upon the balance between suppression of plasticity (caused directly or indirectly by the reaction with S) and the creation of plasticity by heat. Moreover S probably combines at a slower rate with the elastic component so that a product with almost no mech. strength is finally formed. The transformation of energy by rubber depends upon the condition of the rubber as well as the conditions of the test. Heat liberated by elastic strain can be transformed almost quantitatively into mech. work. Heat arising from internal frictional resistance caused both by plastic and by elastic flow is irreversible. Any reduction in time of transfer of energy reduces the quantity lost through plastic flow, while an increase of temp. increases the resistance of the elastic component to strain, but also reduces the resistance of the plastic component to flow. With sufficient increase of temp., there is a large loss of energy because of a considerable though limited permanent flow of the rubber. This cannot be plastic flow of the elastic component since it is limited in magnitude, and it can be explained by a mech. change, e. g., a breaking of the anchorage between the plastic substance and the elastic network. C. C. DAVIS

Accuracy of rubber stress-strain determinations. W. H. STEVENS. *India Rubber J.* 78, 380 (1929).—A comparison of the frequency distribution of tensile strength values obtained by Wiegand and Braendle (C. A. 23, 4372) with those of de Vries (cf. *Estate Rubber*, 166; C. A. 15, 2563) shows a resemblance between the 2 sets of data, including a similar neg. skew. The conditions of testing were different in the 2 cases, so that it is difficult to judge the significance of this similarity. C. C. DAVIS

Effect of milling on the plasticity of reclaimed rubber. D. P. SWISHER AND P. W. SANDERS. *Rubber Age* (N. Y.) 25, 559-60(1929).—An exptl. comparison was made between the plasticizing effect of milling for various lengths of time on (1) tire reclaim alone; (2) a mixt. (50:50) of reclaim and pale crepe and (3) pale crepe alone. Plasticity measurements were made, after cooling 3 hrs., with the Williams app. at 70°. The results are given graphically and in tables. Milling had less effect on the plasticity of reclaimed rubber than it did on raw rubber, and yet a mixt. of raw and reclaimed rubber was more easily plasticized on milling than was raw rubber alone, confirming previous observations that reclaimed rubber aids in the plasticizing of new rubber. After reclaimed rubber formed a solid sheet on the mill, little further diminution in plasticity took place, the only effect of continued milling being to increase the stickiness decidedly. This latter effect makes the use of reclaimed rubber particularly advantageous in frictioning mixts. where skimming from the roll is to be avoided. Judged by tensile product, continuous milling did not impair the phys. properties of reclaimed rubber or of the mixt. of reclaimed and new rubber to any considerable extent. C. C. DAVIS

An attempt at a rational classification of the principal accelerators of vulcanization. G. MARTIN AND R. THIOLLET. *Rubber Chemistry and Technology* 2, 356-61(1929).—English version of C. A. 23, 4101. C. C. DAVIS

The identification of accelerators in [rubber] mixtures by means of ultra-violet radiation. M. L. P. *Rev. gén. caoutchouc* 6, No. 53, 9-12(1929).—By irradiation of rubber mixts. contg. accelerators with ultra-violet light, the different fluorescent colors and tones of color observed make it possible to identify the particular accelerator which is present (cf. Kirchhof, C. A. 22, 2291, 2855). Characteristic colors are also obtained after vulcanization, though they are different from the corresponding ones before vulcanization. If the color of a control rubber mixt. is compared with that of a doubtful rubber mixt., it is possible in mfg. operations to ascertain whether or not an accelerator is present in the doubtful mixt. With the app. which is described and illustrated, not only may the identity of the accelerator be established but also its approx. quantity within a precision of $\approx 5\%$. Ultra-violet radiation is filtered through CuSO_4 soln. or other suitable filter; it is then reflected on the unknown and on the control sample, then passes through a screen which forms a pencil of light for each sample, next through a cell contg. triphenylmethane, and finally the pencils of light are reflected by means of silvered glass into the eye-piece. To det. the quantity of accelerator, pencils of light from control samples contg. different known proportions of accelerator are passed through a prism, the position of which is thereby calibrated to correspond to each proportion of accelerator. C. C. DAVIS

The mode of action of organic accelerators. II. PAUL BARY. *Rev. gén. caoutchouc* 6, No. 53, 3-5(1929); cf. C. A. 23, 4373.—A further discussion, including vulcanization without S. C. C. DAVIS

Further information on surface vulcanization in the quartz light. R. DITMAR AND O. GRÜNFELD. *Gummi-Ztg.* 43, 2801-3, 2859-61(1929).—In continuation of earlier expts. (cf. D., C. A. 23, 4374), exptl. data show the effects obtained with various accelerators, activators and Vulkan colors in rubber mixts. vulcanized by ultra-violet light. Surface vulcanization by the latter radiation is unquestionably a true vulcanization process, since it was proved that S must be present and that the S is activated by the radiation and then enters into reaction with the rubber. Since ultra-violet light is a very active catalyst, activator and accelerator of surface vulcanization when about 3% S is

present, effecting cures in very short times, the addn. of org. accelerators can be completely dispensed with. Most org. accelerators have an unfavorable action. In most cases, Vulkan colors gave excellent shades of color under these conditions, and in combination with other inorg. and org. colors, such as Se red or methylene blue, all kinds of colors and tones can be obtained. In general vulcanization with ultra-violet light can be effected in 4–8 min. at 20–90°, depending upon the support on which the sample rests, the shortest times being obtained on glass. This influence of the support apparently depends upon its heat cond. and heat capacity, for the higher the temp. prevailing during the vulcanization in ultra-violet light, the more rapid is the rate of the latter.

C. C. DAVIS

The oxidation of vulcanized rubber. A. VAN ROSSEM AND P. DEKKER. *Rubber Chemistry and Technology* 2, 341(1929).—English version of C. A. 23, 2598. C. C. D.

The effect of solvents on the stress-strain curve of vulcanized rubber. A. H. TILTMAN AND B. D. PORRITT. *India Rubber J.* 78, 345–6(1929).—The work is of importance because rubber products often come in contact with org. solvents either during or after manuf. Samples of a vulcanizate, the compn. of which was smoked sheet 57, S 3, Ca(OH), 0.5, ZnO 39.5 (cured 3.25 hrs. at 280°F.), were exposed at room temp. to C₆H₆ vapor for various times to obtain different proportions of absorbed C₆H₆, and were then tested (1) immediately, and (2) after drying to the original wt. The results indicate that the rigidity of vulcanized rubber is diminished considerably by the absorption of small proportions of solvent. Thus at 600% elongation the absorption of 5% (by wt.) of C₆H₆ lowered the rigidity by 21%. The greatest effect was obtained with the first 20–30% of absorbed C₆H₆, further absorption having a less marked effect on the stress-strain curve. The absorption of C₆H₆ had little effect on the ultimate elongation, whereas the tensile strength was lowered considerably. This is, however, probably not true of rubber swollen by immersion in liquid, where absorption is far greater. Absorption followed by complete drying produces a slight, technically negligible, permanent effect on the stress-strain curve. The expts. show that when a solvent must be used, either during manuf. or subsequently, the solvent should be as free as possible from components with high b. ps. All stresses were calcd. on the dimensions of the original dry rubber, and therefore the low rigidity of swollen rubber cannot be ascribed merely to a "dilatn." of the rubber by absorbed liquid, but must be a result of a loosening of the cohesive forces among the ultimate particles.

C. C. DAVIS

Effect of temperature on the acetone extract of vulcanized rubber exposed to sunlight. T. YAMAZAKI. *Caoutchouc and gutta-percha* 26, 14691(1929).—On exposure to sunlight in summer, the acetone ext. of undercured rubber became greater than that of the corresponding rubber when overcured, whereas in winter the contrary was true. The mixt., rubber 92.5, S 7.5, was cured to different degrees and the vulcanizates were then exposed for 100 hrs. to sunlight at 10–5° and at 50–60°, and in another series at approx. 20° and at 60–70°. In each series the acetone exts. increased and the free S decreased far more rapidly at the higher than at the lower temps., and the differences were similar to those obtained in summer and in winter. Therefore the differences obtained in summer and in winter are attributable to differences in temp. rather than to differences in the intensity of the sunlight.

C. C. DAVIS

Some preliminary experiments on the causes of the deterioration of ebonite when exposed to light and air. J. D. FRY AND B. D. PORRITT. *India Rubber J.* 78, 307, 309 10(1929).—On the assumption that the increase in the elec. cond. of hard rubber by exposure to light and air is a result of the formation of a surface film contg. acids, expts. were carried on to ascertain the mechanism of this phenomenon. It was found that H₂S is evolved, the rate of evolution being the greatest in direct sunlight, perhaps, however, because of temp. rather than of light effects. This evolution of H₂S results from decompn. of the rubber-S compd., and occurs in the absence of free S, resins, O and water vapor. The rate of evolution increases with increase of temp.

C. C. DAVIS

Treating latex. JOHN MCGAVACK (to Naugatuck Chemical Co.). U. S. 1,730,518, Oct. 8. A resin solvent in which rubber is substantially insol., e. g., a dil. alc., and an alk. material such as NH₃, are added to latex, which is maintained in uncoagulated state and given increased mechanical stability. Latex thus treated is suitable for coating, impregnation, etc. Numerous examples are given. Cf. C. A. 23, 3375.

Treating rubber latex. ERNEST A. HAUSER (to K. D. P., Ltd.). U. S. 1,729,651, Oct. 1. In producing a compounded product contg. all the solid and dissolved constituents of the original latex and in which the latex is still in a reversible condition, protective agents are added to the latex and it is concd. by evapn. until a completely reversible

colloidal, paste-like product is obtained, compounding and vulcanizing ingredients are gradually mixed with it and are uniformly dispersed and compounded while conserving the colloidal properties and stability of the latex towards friction, pressure, agitation, etc., by effecting and continuing the mixing with the least possible friction. The product is suitable for squirting, pressing or molding.

Rubber composition. CHARLES H. CAMPBELL (to American Glue Co.). U. S. 1,729,709, Oct. 1. A metal albuminate such as that of Fe is mixed with rubber before vulcanization and serves to improve its durability.

Rubber compositions. MERWYN C. TRAGUE (to Naugatuck Chemical Co.). U. S. 1,730,485, Oct. 8. In order to improve the union between rubber and pulverulent materials such as clay or lampblack, the latter are evacuated and treated with NH_3 gas in the presence of moisture so that the gas is adsorbed on and serves to peptize the material and the latter is then combined with the rubber. Cf. C. A. 23, 1527.

Rubber-like composition. JOHN C. WICHMANN (to Cactus Rubber Co. of America). U. S. 1,730,702, Oct. 8. A product which is suitable for use as a rubber substitute comprises a rubber-like material resulting from the boiling of the concd. juice of cactus in assocn. with Na tungstate, Na molybdate, boiled linseed oil and rubber dissolved in turpentine, and drying and oxidizing.

Apparatus for calendering rubberized cord fabric. JOHN F. HOGAN (to B. F. Goodrich Co.). U. S. 1,730,657, Oct. 8. Structural features.

Artificial flowers comprising united layers of sheet rubber. STEWART H. ROGERS. U. S. 1,730,628, Oct. 8. The marginal edges of the rubber are cemented together and stiffening material such as paper or cloth is placed between the rubber layers.

Rubber-coated fabric suitable for ornamenting cloth. MATTHEW LINDENBERG. U. S. 1,730,665, Oct. 8. Cloth is coated with rubber cement, a coating of powdered rosin is applied to the cement, the latter is dried, another coating of the rubber cement is applied and dried, and a layer of gutta percha is applied to the cement-coated surface.

Reclaimed rubber. CHARLES H. CAMPBELL (to American Glue Co.). U. S. 1,729,706, Oct. 1. Rubber scrap is devulcanized by a process of hydrolytic character, in which the material is subjected to the action of cleavage products obtained from collagen. U. S. 1,729,707 specifies cleavage products of keratin instead of those of collagen. U. S. 1,729,708 relates to reclaimed rubber having cleavage products from the hydrolytic decomn. of ox blood compounded with it by an alk. process having a hydrolytic action which renders the ox blood and its hydrolyzed products sol.

Vulcanizing hose. ERNEST BLAKER (to B. F. Goodrich Co.). U. S. 1,730,639, Oct. 8. Hose is distended against an exterior confining device by maintaining a distending fluid such as water under pressure within the hose during vulcanization and the hose is cooled in distended condition by maintaining a cooling fluid under pressure within the hose while causing it to flow through the latter. An app. is described.

CHEMICAL ABSTRACTS

No. 23

I. AUTHOR INDEX

("P" before a page number indicates "Patent")

NOTE.—In the transliteration of names originally written in Russian, the system followed so far as possible is that of *Nature* 41, 390-7 (1890), in which *v* is used instead of the *w* or *f* of other spellings, *sh* instead *sch*, *ch* instead of *tch*, *i* instead of *j* or *y*, etc. Thus Pavlov, not Pawlow; Chugaev, not Tschugaeff. To make quite sure, users of the index should in such a case look under both spellings.
